1

COLLECTIONS OF COMPOUNDS

This invention relates to pyrrolobenzodiazepines, to methods of synthesizing these compounds on solid supports, and to collections of these compounds. This invention further relates to methods for identifying and isolating pyrrolobenzodiazepine compounds with useful and diverse activities from such collections.

10 Background to the invention

Compounds having biological activity can be identified by screening diverse collections of compounds (i.e. libraries of compounds) produced through synthetic chemical techniques. Such screening methods include methods wherein the library comprises a plurality of compounds synthesized at specific locations on the surface of a solid support whereby a receptor is appropriately labelled to bind to and identify a compound, e.g., fluorescent or radioactive labels. Correlation of the labelled receptor bound to the support and its location on the support identifies the binding compound (US 5,143,854).

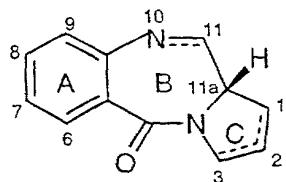

Central to these methods is the screening of a multiplicity of compounds in the library and the ability to identify the structures of the compounds which have a requisite biological activity. In order to facilitate synthesis and identification, the compounds in the library are typically formed on solid supports. Usually each such compound is covalently attached to the support via a cleavable or non-cleavable linking arm. The libraries of compounds can be screened either on the solid support or as cleaved products to identify compounds having good biological activity.

A particular class of compounds which would be useful for inclusion in screening libraries are pyrrolobenzodiazepines (PBDs). PBDs have the ability to recognise and bond to specific sequences of DNA; the most preferred sequence is PuGPU (Purine-Guanine-Purine). The first PBD antitumour antibiotic, anthramycin, was discovered in 1965 (Leimgruber et al., 1965 J.

Am. Chem. Soc., 87, 5793-5795; Leimgruber et al., 1965 J. Am. Chem. Soc., 87, 5791-5793). Since then, a number of naturally occurring PBDs have been reported, and over 10 synthetic routes have been developed to a variety of analogues (Thurston et al., 5 1994 Chem. Rev. 1994, 433-465). Family members include abbeymycin (Hochlowski et al., 1987 J. Antibiotics, 40, 145-148), chicamycin (Konishi et al., 1984 J. Antibiotics, 37, 200-206), DC-81 (Japanese Patent 58-180 487; Thurston et al., 1990, Chem. Brit., 26, 767-772; Bose et al., 1992 Tetrahedron, 48, 751-758), 10 mazethramycin (Kuminoto et al., 1980 J. Antibiotics, 33, 665-667), neothramycins A and B (Takeuchi et al., 1976 J. Antibiotics, 29, 93-96), porothramycin (Tsunakawa et al., 1988 J. Antibiotics, 41, 1366-1373), prothracarcin (Shimizu et al., 1982 J. Antibiotics, 29, 2492-2503; Langley and Thurston, 1987 J. Org. 15 Chem., 52, 91-97), sibanomicin (DC-102) (Hara et al., 1988 J. Antibiotics, 41, 702-704; Itoh et al., 1988 J. Antibiotics, 41, 1281-1284), sibiromycin (Leber et al., 1988 J. Am. Chem. Soc., 110, 2992-2993) and tomamycin (Arima et al., 1972 J. Antibiotics, 25, 437-444).

20

PBDs are of the general structure:

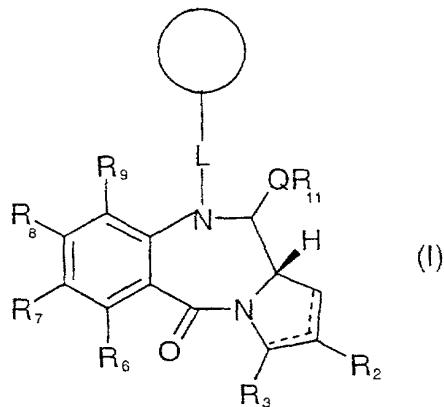

They differ in the number, type and position of substituents, in both their aromatic A rings and pyrrolo C rings, and in the 25 degree of saturation of the C ring. There is either an imine (N=C), a carbinolamine (NH-CH(OH)) or a carbinolamine methyl ether (NH-CH(OMe)) at the N10-C11 position which is the electrophilic centre responsible for alkylating DNA. All of the known natural products have an (S)-configuration at the chiral 30 C11a position which provides them with a right-handed twist when viewed from the C ring towards the A ring. This gives them the

appropriate three-dimensional shape for isohelicity with the minor groove of B-form DNA, leading to a snug fit at the binding site (Kohn, 1975 in *Antibiotics III*. Springer-Verlag, New York, pp. 3-11 ; Hurley and Needham-VanDevanter, 1986 *Acc. Chem. Res.*, 19, 230-237). Their ability to form an adduct in the minor groove, enables them to interfere with DNA processing, hence their use as antitumour agents.

Disclosure of the Invention

10 A first aspect of the present invention relates to compounds of formula (I) :

wherein:

15 R_2 and R_3 are independently selected from: H, R, OH, OR, =O, =CH-R, =CH₂, CH₂-CO₂R, CH₂-CO₂H, CH₂-SO₂R, O-SO₂R, CO₂R, COR and CN, and there is optionally a double bond between C1 and C2 or C2 and C3;

20 R_6 , R_7 , R_8 and R_9 are independently selected from H, R, OH, OR, halo, nitro, amino, Me₃Sn; or R_7 and R_8 together from a group -O-(CH₂)_p-O-, where p is 1 or 2;

R_{11} is either H or R;

Q is S, O or NH;

L is a linking group, or less preferably a single bond;

O is a solid support;

25 where R is a lower alkyl group having 1 to 10 carbon atoms, or an alkaryl group (i.e. an alkyl group with one or more aryl substituents) preferably of up to 12 carbon atoms, whereof the alkyl group optionally contains one or more carbon-carbon system,

or an aryl group, preferably of up to 12 carbon atoms; and is optionally substituted by one or more halo, hydroxy, amino, or nitro groups, and optionally contains one or more hetero atoms, which may form part of, or be, a functional group; and

5 where one or more of R₂, R₃, R₆, R, and R₈ may alternatively be independently X-Y-A-, where X is selected from -COZ', NHZ, SH, or OH, where Z is either H or a nitrogen protecting group, Z' is either OH or an acid protecting group, Y is a divalent group such that HY = R, and A is O, S, NH, or a single bond.

10 If R is an aryl group and contains a hetero atom, then R is a heterocyclic group. If R is an alkyl chain, and contains a hetero atom, the hetero atom may be located anywhere in the alkyl chain, e.g. -O-C₂H₅, -CH₂-S-CH₃, or may form part of, or be, a 15 functional group, e.g. carbonyl, hydroxy, cyano, ester.

R and HY groups are preferably independently selected from a lower alkyl group having 1 to 10 carbon atoms, or an aralkyl group, preferably of up to 12 carbon atoms, or an aryl group, 20 preferably of up to 12 carbon atoms, optionally substituted by one or more halo, hydroxy, amino, or nitro groups. It is more preferred that R and HY groups are independently selected from a lower alkyl group having 1 to 10 carbon atoms optionally substituted by one or more halo, hydroxy, amino, or nitro groups. 25 It is particularly preferred that R or HY are unsubstituted straight or branched chain alkyl groups, having 1 to 10, preferably 1 to 6, and more preferably 1 to 4, carbon atoms, e.g. methyl, ethyl, propyl, butyl. R may be selected only from methyl and ethyl.

30 Alternatively, R₆, R₇, R₈ and R, may preferably be independently selected from R groups with the following structural characteristics:

- (i) an optionally substituted phenyl group;
- 35 (ii) an optionally substituted ethenyl group;
- (iii) an ethenyl group conjugated to an electron sink.

The term 'electron sink' means a moiety covalently attached to a

compound which is capable of reducing electron density in other parts of the compound. Examples of electron sinks include cyano, carbonyl and ester groups.

5 The term 'nitrogen protecting group' has the meaning usual in synthetic chemistry, particularly synthetic peptide chemistry. It means any group which may be covalently bound to the nitrogen atom of any grouping of the molecule, particularly of the amine grouping, and permits reactions to be carried out upon the
10 molecule containing this protected grouping without its removal. Nevertheless, it is able to be removed from the nitrogen atom without affecting the remainder of the molecule. Suitable amine protecting groups for the present invention include Fmoc (9-fluorenylmethoxycarbonyl), Nvoc (6-nitroveratryloxycarbonyl),
15 Teoc (2-trimethylsilylethyloxycarbonyl), Troc (2,2,2-trichloroethyloxycarbonyl), Boc (t-butyloxycarbonyl), CBZ (benzyloxycarbonyl), Alloc (allyloxycarbonyl) and Psec (2-(phenylsulphonyl)ethyloxycarbonyl). Other suitable groups are described in Protective Groups in Organic Synthesis, T Green and P Wuts, published by Wiley, 1991 which is incorporated herein by reference.
20

The term 'acid protecting group' has the meaning usual in synthetic chemistry. It means any group which may be reacted
25 with any carboxylic acid moiety of the molecule, and permits reactions to be carried out upon the molecule containing this protected grouping without its removal. Nevertheless, the carboxylic acid moiety is able to be regenerated without affecting the remainder of the molecule. Suitable acid
30 protecting groups include esters, for example methyl ester, and -O-CH₂=CH₂. Other suitable groups are described in Protective Groups in Organic Synthesis, T Green and P Wuts, published by Wiley, 1991.

35 It is preferred that in compounds of formula I, if one of R₂, R₃, R₆, R₇ and R₈ is to be X-Y-A-, then it is either R₂ or R₈ that is X-Y-A-, and more preferably it is R₈ that is X-Y-A-.

In compounds of formula I, Q is preferably O, and R₁₁ is preferably H, Me or Et, more preferably H or Me. Independently, R₆ is preferably H or R, more preferably H or Me, R₉ is preferably H, and R₈ is preferably an alkoxy group, and more preferably methoxy or ethoxy. It is further preferred that R₂ and R₃ are H.

If there is a double bond in the pyrrolo C ring, it is preferably between C2 and C3.

10

A second aspect of the invention relates to compounds of formula I as defined in the first aspect of the invention except that one or more of R₂, R₃, R₆, R₇ and R₈ are independently:

15 where:

Y and A are as defined in the first aspect of the invention;

X' is CO, NH, S or O₂;

T is a combinatorial unit;

20 and n is a positive integer.

In compounds of formula I according to the second aspect, it is preferred that R₂ and/or R₈ are independently:

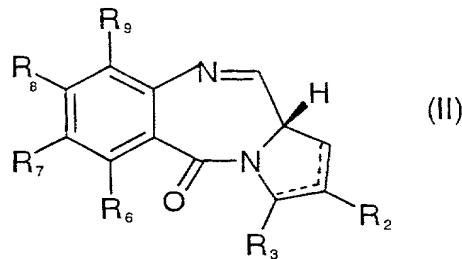

25

It is preferred that X' is either CO or NH. n may preferably be from 1 to 16, and more preferably from 3 to 14. It is also preferred that it is R₈ which is H-(T)_n-X'-Y-A-.

30

A third aspect of the present invention relates to compounds of formula II:

preferably made from a compound of formula **I** as described in the first or second aspect of the invention by removing the compound of formula **II** from the solid support by cleaving the linking group L, where R₂, R₃, R₆, R₇, R₈, and R₉ are as defined in the first or second aspect of the invention.

A fourth aspect of the present invention is a method of making a compound according to the third aspect of the invention from a compound of formula **I** as described in the first or second aspect of the invention by removing the compound of formula **II** from the solid support by cleaving the linking group L.

A fifth aspect of the invention relates to a compound of formula **II** as described in the third aspect of the invention for use in a method of therapy. Conditions which may be treated include gene-based diseases, including neoplastic diseases and, for example Alzheimer's disease, and bacterial, parasitic and viral infections.

In accordance with this aspect of the present invention, the compounds provided may be administered to individuals. Administration is preferably in a "therapeutically effective amount", this being sufficient to show benefit to a patient. Such benefit may be at least amelioration of at least one symptom. The actual amount administered, and rate and time-course of administration, will depend on the nature and severity of what is being treated. Prescription of treatment, e.g. decisions on dosages etc., is within the responsibility of general practitioners and other medical doctors.

A compound may be administered alone or in combination with other treatments, either simultaneously or sequentially dependent upon the condition to be treated.

Pharmaceutical compositions according to the present invention, and for use in accordance with the present invention, may comprise, in addition to the active ingredient, i.e. a compound of formula **II**, a pharmaceutically acceptable excipient, carrier,

buffer, stabiliser or other materials well known to those skilled in the art. Such materials should be non-toxic and should not interfere with the efficacy of the active ingredient. The precise nature of the carrier or other material will depend on 5 the route of administration, which may be oral, or by injection, e.g. cutaneous, subcutaneous or intravenous.

Pharmaceutical compositions for oral administration may be in tablet, capsule, powder or liquid form. A tablet may comprise a 10 solid carrier or an adjuvant. Liquid pharmaceutical compositions generally comprise a liquid carrier such as water, petroleum, animal or vegetable oils, mineral oil or synthetic oil. Physiological saline solution, dextrose or other saccharide 15 solutions, or glycols such as ethylene glycol, propylene glycol or polyethylene glycol may be included. Capsules may include a solid carrier such as gelatin.

For intravenous, cutaneous or subcutaneous injection, or 20 injection at the site of affliction, the active ingredient will be in the form of a parenterally acceptable aqueous solution which is pyrogen-free and which has suitable pH, isotonicity and stability. Those of relevant skill in the art are well able to 25 prepare suitable solutions using, for example, isotonic vehicles such as Sodium Chloride Injection, Ringer's Injection or Lactated Ringer's Injection. Preservatives, stabilisers, buffers, antioxidants and/or other additives may be included, as required.

A sixth aspect of the present invention relates to the use of a compound of formula **II** as described in the third aspect of the 30 present invention in the preparation of a medicament for the treatment of a gene-based disease or a bacterial, parasitic or viral infection. The preparation of a medicament is described in relation to the fourth aspect of the invention.
In further aspects, the invention provides processes for 35 preparing compounds according to the first and second aspects of the present invention.

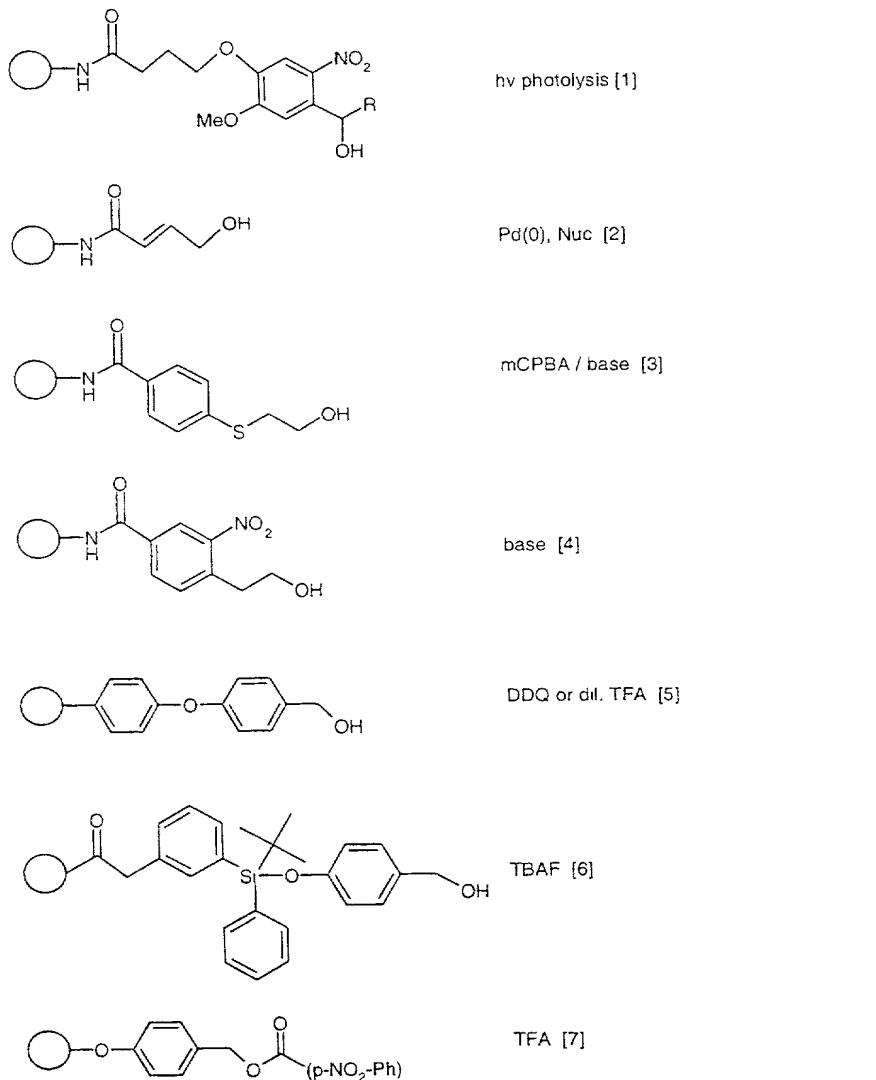

Solid support

The term 'solid support' refers to a material having a rigid or semi-rigid surface which contains or can be derivatized to contain reactive functionality which can serve to covalently link 5 a compound to the surface thereof. Such materials are well known in the art and include, by way of example, silicon dioxide supports containing reactive Si-OH groups, polyacrylamide supports, polystyrene supports, polyethyleneglycol supports, and the like. Such supports will preferably take the form of small 10 beads, pins/crowns, laminar surfaces, pellets or disks. Other conventional forms may be used.

Linker group

The linking groups preferred for the present application are ones 15 which contain at least one covalent bond which can be readily broken by specific chemical reactions, or other changes (e.g. light or a pH change), thereby providing for liberation of compounds free from the solid support. The chemical reactions employed to break the covalent bond are selected so as to be 20 specific for the desired bond breakage thereby preventing unintended reactions occurring elsewhere in the molecule. The linking group is selected relative to the synthesis of the compounds formed on the solid support so as to prevent premature cleavage of the compound or its precursors from the solid support 25 as well as to avoid interference with any of the procedures employed during synthesis of the compound on the support.

Examples of linking groups are set out below (shown as available 30 form), along with suggested cleavage method(s) for the linking group. These groups are commercially available or have been reported in the literature. After conversion to the appropriate chloroformate, for example by reaction with triphosgene in the presence of pyridine, they can be used to attach to anthranilic acids (for use in providing the protected A-rings of 35 pyrrolobenzodiazepines) via carbamate linkages. Some resins, e.g. p-nitrophenyl carbonate Wang resin may couple to the anthranilic acids without need for intermediate transformation to the chloroformate.

Combinatorial Unit

The term 'combinatorial unit' means any monomer unit which can be used to build a chain as shown in a compound of formula **I** as

20 defined in the second aspect of the present invention, or a compound of formula **II**, when derived from a compound of formula **I** as defined in the second aspect of the present invention. The chain is usually attached to the PBD core by a joining group through the pro N10 position. Examples of molecules suitable for 25 such chain building are found in Schreiber et al. (*JACS*, 120, 1998, pp.23-29), which is incorporated herein by reference. An important example of a unit is an amino acid residue. Chains may be synthesised by means of amine-protected amino acids. Fmoc protected amino-acids are available from a number of sources, 30 such as Sigma and NovaBiochem. Both natural and unnatural amino acids can be used, e.g. D- and L-amino acids and heterocyclic amino acids. In particular, heterocyclic amino acids of the type found in the construction of netropsin and distamycin are of interest because of their DNA-recognition properties.

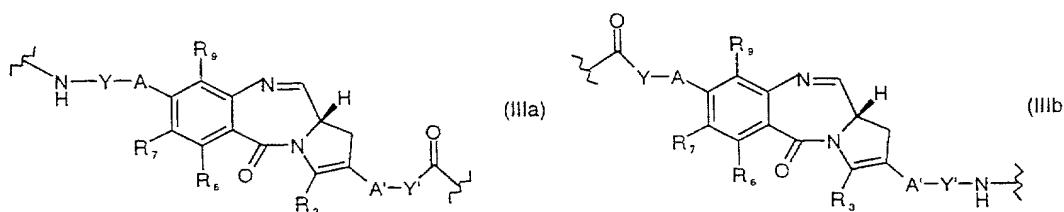

35

Amine units can be used to make up peptoids: see Soth, M.J. and Nowick, J.S. 1997, Unnatural oligomer libraries, *Curr. Opin. Chem. Biol.* 1, no. 1: 120-129; Zuckermann et al., 1994, *Discovery*

of Nanomolecular Ligands for 7-Transmembrane G-Protein-Coupled Receptors from a Diverse N-(Substituted)glycine Peptoid Library, *Journal of Medicinal Chemistry* 37: 2678-85; Figliaozzi, GMR et al., 1996, Synthesis of N-substituted Glycine Peptoid Libraries, 5 *Methods in Enzymology*, 267: 437-47; Simon, R.J. et al., 1992, Peptoids: A Modular Approach to Drug Discovery, *Proc. 25 A type of combinatorial unit of particular relevance to the present invention is one based on the pyrrolobenzodiazepine structures; these are of general formulae IIIa and IIIb:

30 wherein R₃, R₆, R₇, R₉, A and Y are as defined in the first aspect of the invention, A' and Y' are independently selected from the possible groups for A and Y respectively. In order for such

combinatorial units to be added to the combinatorial chain, they may be added in their protected form as shown in general formulae **IIIc** and **IIId**:

where R_3 , R_6 , R_7 , R_9 , A , Y , A' and Y' are as defined above, Q and R_{11} are as defined in the first aspect of the invention, and R_{10} is a nitrogen protecting group. It is possible that the combinatorial units may remain in their protected form until the compound has been cleaved from the solid support, or until any other components of the compound have been deprotected.

The present invention relates to libraries, or collections, of compounds all of which are represented by a single one of the formulae I or II. The diversity of the compounds in a library may reflect the presence of compounds differing in the identities of one or more of R₂, R₃, R₆, R₇, R₉, R₁₁ and Q and/or in the identities of the combinatorial units T (when present). The number of members in the library depends on the number of variants, and the number of possibilities for each variant. For example, if it is the combinatorial units which are varied, and there are 3 combinatorial units, with 3 possibilities for each unit, the library will have 27 compounds. 4 combinatorial units and 5 possibilities for each unit gives a library of 625 compounds. If for instance there is a chain of 5 combinatorial units with 17 possibilities for each unit, the total number of members in the library would be 1.4 million. A library may therefore comprise more than 1 000, 5 000, 10 000, 100 000 or a million compounds, which may be arranged as described below.

In the case of free compounds (formula II), the individual compounds are preferably in discrete volumes of solvents, e.g. in tubes or wells. In the case of bound compounds (formula I) the

individual compounds are preferably bound at discrete locations, e.g. on respective pins/crowns or beads. The library of compounds may be provided on a plate which is of a suitable size for the library, or may be on a number of plates of a standard size, e.g. 96 well plates. If the number of members of the library is large, it is preferable that each well on a plate contains a number of related compounds from the library, e.g. from 10 to 100. One possibility for this type of grouping of compounds is where only a subset of the combinatorial units, or substituents, are known and the remainder are randomised; this arrangement is useful in iterative screening processes(see below). The library may be presented in other forms that are well-known.

15 A further aspect of the present invention is a method of preparing a collection, or library of compounds as discussed above. If the diversity of the library is in the combinatorial units, then the library may be synthesised by the stepwise addition of protected combinatorial units to a PBD core, each 20 step being interposed by a deprotection step. Such a method is exemplified later. If the diversity of the library is in the substituent groups, the library may be synthesised by carrying out the same synthetic methods on a variety of starting materials or key intermediates, which already possess the necessary 25 substituent patterns.

The present invention also relates to a method of screening the compounds of formula **II** to discover biologically active compounds. The screening can be to assess the binding interaction with nucleic acids, e.g. DNA or RNA, or proteins, or to assess the affect of the compounds against protein-protein or nucleic acid-protein interactions, e.g. transcription factor DP-1 with E2F-1, or estrogen response element (ERE) with human estrogen receptor (a 66 kd protein which functions as a hormone-activated transcription factor, the sequence of which is published in the art and is generally available). The screening can be carried out by bringing the target macromolecules into contact with individual compounds or the arrays or libraries of

individual compounds described above, and selecting those compounds, or wells with mixtures of compounds, which show the strongest effect.

5 This effect may simply be the cytotoxicity of the compounds in question against cells or the binding of the compounds to nucleic acids. In the case of protein-protein or nucleic acid-protein interactions, the effect may be the disruption of the interaction studied.

10 Protein-protein interactions can be measured in a number of ways, e.g. FRET (fluorescence resonance energy transfer) which involves labelling one of the proteins with a fluorescent donor moiety and the other with an acceptor which is capable of absorbing the 15 emission from the donor; the fluorescence signal of the donor will be altered depending on the interaction between the two proteins. Another method of measuring protein-protein interactions is by enzymatic labelling, using, for example, horseradish peroxidase.

20 The screening process may undergo several iterations by selecting the most active compounds, or groups of compounds, tested in each iteration; this is particularly useful when testing arrays of wells which include mixtures of related compounds. Furthermore, 25 if the wells contain compounds for which only a subset of the combinatorial units, or substituents, are known, but the rest are randomised, subsequent iterations can be carried out by synthesising compounds possessing the selected known (and successful) combinatorial unit, or substituent, pattern, but with 30 further specified combinatorial units, or substituents, replacing the previously randomised combinatorial units, or substituents, adjacent the already known pattern; the remaining combinatorial units, or substituents, are randomised as in the previous iteration. This iterative method enables the identification of 35 active members of large libraries without the need to isolate every member of the library.

A further feature of this aspect is formulation of a selected

compound or selected compounds with pharmaceutically acceptable carriers or diluents.

A further aspect of the present invention relates to the use of
5 compounds of formula **II** in target validation. Target validation is the disruption of an identified DNA sequence to ascertain the function of the sequence, and a compound of formula **II** can be used to selectively bind an identified sequence, and thus disrupt its function.

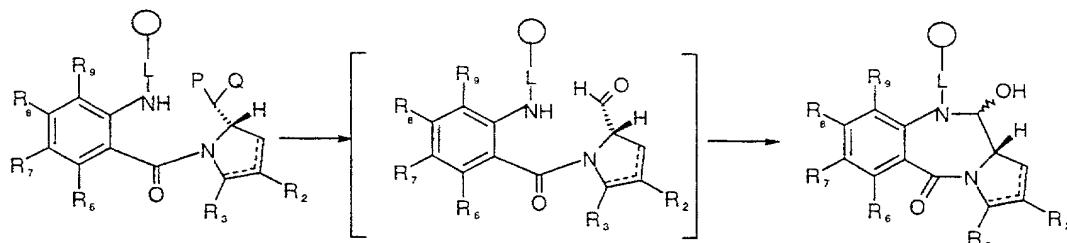

10

Compounds of formula **II** can also be used in functional genomics to ascertain the biological function of individual genes, by blocking this biological action. This is a further aspect of the invention.

15

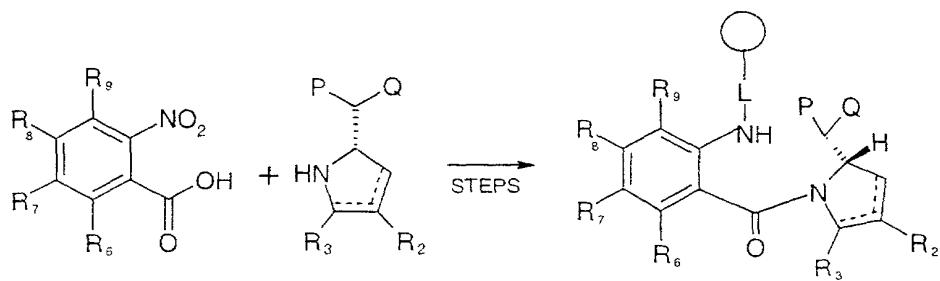

Synthesis Methods

A key step in a preferred route to compounds of formula **I** is a cyclisation procedure to produce the B-ring, involving generation of an aldehyde (or functional equivalent thereof) at what will be
20 the 11-position, and attack thereon by the pro-10-nitrogen:

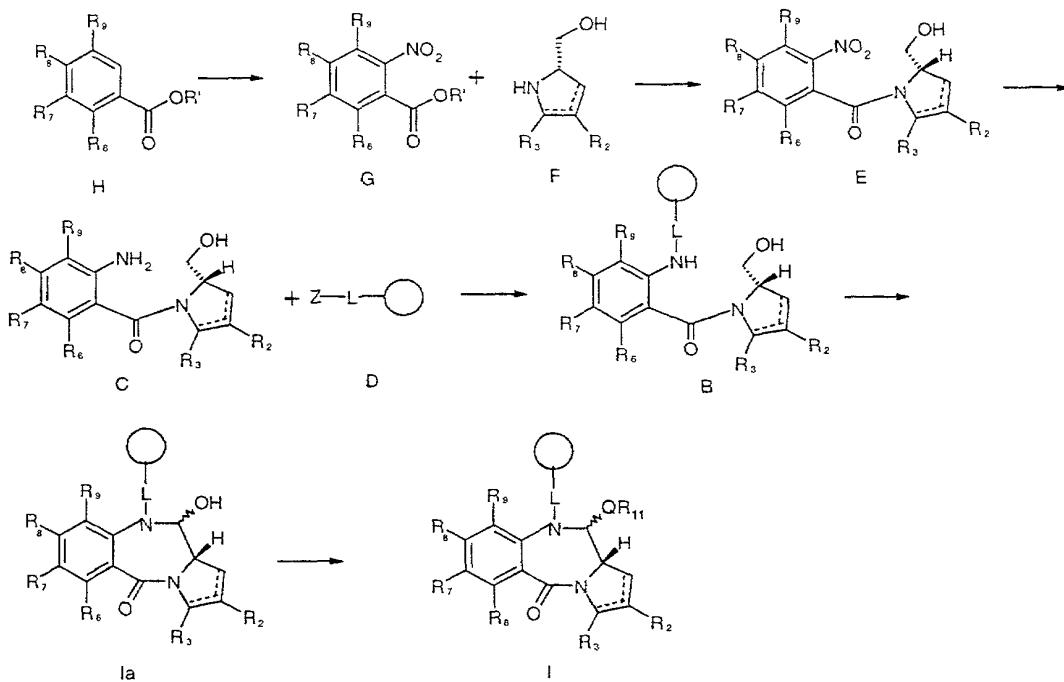

The "masked aldehyde" -CPQ may be an acetal or thioacetal, which may be cyclic, in which case the cyclisation involves unmasking. Alternatively, it may be an alcohol -CHOH, in which case the reaction involves oxidation, e.g. by means of TPAP or DMSO (Swern
25 oxidation).

The masked aldehyde compound can be produced by condensing a corresponding 2-substituted pyrrolidine with a 2-nitrobenzoic acid:

5

A process involving the oxidation-cyclization procedure is illustrated in scheme 1 (an alternative type of cyclisation will be described later with reference to scheme 2).

Scheme 1

10

If R₁₁ is other than hydrogen, the compound of formula I, may be prepared by direct etherification of the alcohol Ia. Compounds

with Q=S can be prepared by treatment of the corresponding alcohol **Ia** with R₁₁SH, and a catalyst (usually a Lewis Acid such as Al₂O₃). For compounds where Q=NH, these can be prepared by reacting an amine, R₁₁NH, e.g. C₃H₅NH with the corresponding alcohol **Ia** normally with a catalyst, such as a Lewis Acid.

Exposure of the alcohol **B** to tetrapropylammonium perruthenate (TPAP)/N-methylmorpholine -oxide (NMO) over A4 sieves results in oxidation accompanied by spontaneous B-ring closure to afford the desired product. The TPAP/NMO oxidation procedure is found to be particularly convenient for small scale reactions while the use of DMSO-based oxidation methods, particularly Swern oxidation, proves superior for larger scale work (e.g. > 1 g).

The uncyclized alcohol **B** may be prepared by the reaction of the amino alcohol **C**, generally in solution, with the linking group **L** attached to a solid support **D**. The linking group is preferably terminated with a chloroformate or acid chloride functionality. This reaction is generally carried out in the presence of a base such as pyridine (preferably 2 equivalents) at a low temperature (e.g. at 0°C).

The key amino alcohol **C** may be prepared by reduction of the corresponding nitro compound **E**, by choosing a method which will leave the rest of the molecule intact. For example, treatment of **E** with tin (II) chloride in a suitable solvent, e.g. refluxing methanol, generally affords, after the removal of the tin salts, the desired product **C** in high yield.

Exposure of **E** to hydrazine/Raney nickel avoids the production of tin salts and may result in a higher yield of **C**, although this method is less compatible with the range of possible C and A-ring substituents. For instance, if there is C-ring unsaturation (either in the ring itself, or in R₂ or R₃), this technique may be unsuitable.

The nitro compound of formula **E** may be prepared by coupling the

appropriate *o*-nitrobenzoyl chloride to a compound of formula F, e.g. in the presence of K₂CO₃, at -25°C under a N₂ atmosphere.

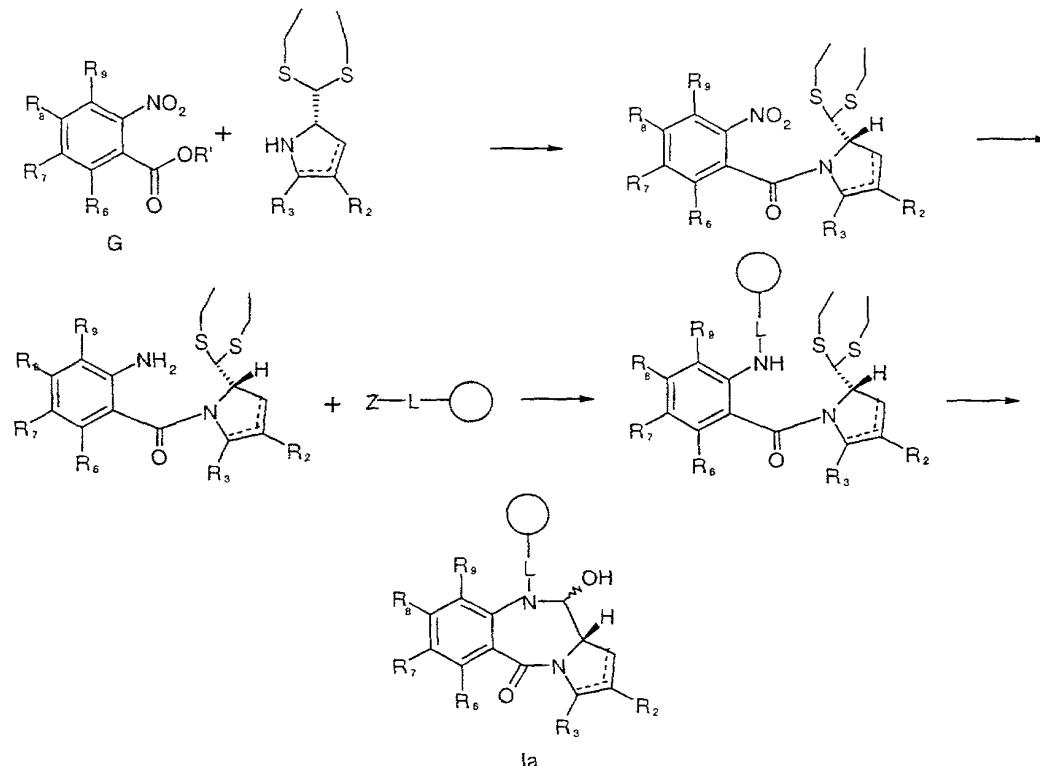

Compounds of formula F can be readily prepared, for example by olefination of the ketone derived from L-trans-hydroxy proline.

5 The ketone intermediate can also be exploited by conversion to the enol triflate for use in palladium-mediated coupling reactions.

The *o*-nitrobenzoyl chloride is synthesised from the *o*-nitrobenzoic acid (or alkyl ester, after hydrolysis) of formula G, which itself is prepared from the vanillic acid (or alkyl ester) derivative H. Many of these are commercially available and some are disclosed in Althuis, T.H. and Hess, H.J., J. Medicinal Chem., 20(1), 146-266 (1977).

15

Alternative Cyclisation (Scheme 2)

Scheme 2

In scheme 1, the final or penultimate step was an oxidative cyclisation. An alternative route, using thioacetal coupling, is

shown in scheme 2. Mercury-mediated unmasking causes cyclisation to the desired compound (**Ia**).

The thioacetal compound may be prepared as shown in scheme 2:

5 the thioacetal protected C-ring [prepared via a literature method: Langley, D.R. & Thurston, D.E., *J. Organic Chemistry*, **52**, 91-97 (1987)] is coupled to the o-nitrobenzoic acid (or alkyl ester) **G** using a literature procedure. The resulting nitro compound cannot be reduced by hydrogenation because of the
10 thioacetal group, so the tin(II) chloride method is used to afford the amine. This is then N-protected, e.g., by reaction with a chloroformate or acid chloride, such as p-nitrobenzylchloroformate.

15 Acetal containing C-rings can be used as an alternative in this type of route with deprotection including other methods, including the use of Lewis Acid conditions (see example 3).

In the above synthesis schemes, the derivatisation of the A-ring
20 is shown as being complete before the compounds are attached to the solid support. This is preferred if the substituents are groups such as alkoxy or nitro. On the other hand, substituent groups such as alkyl or alkenyl could be added to the A-ring after the coupling of the compound to the solid support. This
25 may be achieved by R₆, R₇, R₈ or R₉ being easily replaceable groups, such as a halogen atom.

An alternative synthesis route (as in Examples 3 and 4 - figures 4 and 5) is to attach the component which will form the A ring to
30 the solid support at the pro N10 position, before joining the component which will form the C ring.

Embodiments of the present invention will now be described by way of example with reference to the accompanying drawings in which:
35 Figure 1 is a synthesis scheme for a compound according to the invention;
Figure 2 is a synthesis scheme for another compound according to the invention;

Figure 3 is a synthesis scheme for an intermediate in the synthesis of a compound according to the invention;

Figures 4 and 5 are synthesis schemes for further compounds according to the invention;

5 Figure 6 is an HPLC time course for cleavage of the compound made by the scheme shown in figure 2;

Figure 7 is a graph which illustrates the results shown in figure 6;

Figure 8 is a graph illustrating the cytotoxicity of the compound
10 made by the scheme shown in figure 2; and

Figures 9 - 12 are a synthesis scheme for further compounds according to the invention.

General Methods

15 Melting points (mp) were determined on a Gallenkamp P1384 digital melting point apparatus and are uncorrected. Infrared (IR) spectra were recorded using a Perkin-Elmer 297 spectrophotometer. ¹H- and ¹³C- NMR spectra were recorded on a Jeol GSX 270 MHZ FT-NMR spectrometer operating at 20°C +/-1°C. Chemical shifts are reported in parts per million (δ) downfield from tetramethylsilane (TMS). Spin multiplicities are described as: s (singlet), bs (broad singlet), d (doublet), dd (doublet of doublets), t (triplet), q (quartet), p (pentuplet) or m (multiplet). Mass spectra (MS) were recorded using a Jeol JMS-DX 303 GC Mass Spectrometer (EI mode: 70eV, source 117-147°C). Accurate molecular masses (HRMS) were determined by peak matching using perfluorokerosene (PFK) as an internal mass marker, and FAB mass spectra were obtained from a glycerol/thioglycerol/trifluoroacetic acid (1:1:0.1) matrix with a source temperature of 180°C. Optical rotations at the Na-D line were obtained at ambient temperature using a Perkin-Elmer 141 Polarimeter. Analytical results were generally within +/- 0.2% of the theoretical values. Flash chromatography was performed using Aldrich flash chromatography "Silica Gel-60" (E. Merck, 230-400 mesh). Thin-layer chromatography (TLC) was performed using GF₂₅₄ silica gel (with fluorescent indicator) on glass plates. All solvents and reagents, unless otherwise stated, were supplied by the Aldrich Chemical Company Ltd. and

were used as supplied without further purification. Anhydrous solvents were prepared by distillation under a dry nitrogen atmosphere in the presence of an appropriate drying agent, and were stored over 4Å molecular sieves or sodium wire. Petroleum ether refers to the fraction boiling at 60-80°C.

Overall Synthetic Strategy for Examples 1 and 2

The pyrrolobenzodiazepine products **8** and **13** were obtained in solution by exposure to light at 365 nm; light at this wavelength promotes the conversion of the photolabile linker into a nitroso aldehyde, in the process liberating the PBD from the resin. In addition to this photolabile linker, other fluoride, mild acid, mild base or palladium (0)/nucleophile labile linkers may also be used in the construction of PBD libraries.

The bead bound PBDs **7** and **12** (figures 1 and 2 respectively) were prepared by oxidation of the primary-alcohol-bearing resins **6** and **11** with SO₃.Pyridine complex in DMSO. Other oxidizing systems such as TPAP/NMO, the Dess Martin reagent, and oxalyl chloride/DMSO (Swern oxidation) are also effective (see example 5). The primary alcohol resins **6** and **11** were obtained from the coupling of the bead bound anthranilic acids **4** and **10** to pyrrolidine methanol **5**. Alternatively, coupling (2S, 4R)-2-t-butylidimethylsilyloxyethyl-4-hydroxy proline to the bead-bound anthranilic acid offers the opportunity of elaborating the PBD C-ring at the pro-C2-position on bead via, for example, olefination. Finally, the bead bound anthranilic acids **4** and **10** were obtained by coupling the commercially available anthranilic acids (over 40 anthranilic acids are commercially available) to the o-nitrobenzylchloroformate resin **2** which was in turn obtained from the commercially available resin **1** by treatment with triphosgene in the presence of dry pyridine.

Example 1: Synthesis of the Resin-Bound C7-Iodo-PBD Carbinolamine (7) (Figure 1)

Ortho-nitro benzyl chloroformate Resin (2)

Hydroxymethyl-photolinker NovaSyn TG resin **1** (0.2 g, 0.24 mmol/g loading) was placed in a vessel, fitted with a sinter.

Dichloromethane CH₂Cl₂ (3 mL) was added and the vessel shaken for 30 minutes. The suspension was then cooled to 0°C before adding triphosgene (0.15 g, 0.5 mmol) in CH₂Cl₂, and pyridine (40 µL, 0.5 mmol), and the vessel allowed to shake at room temperature for 16 hours. The chloroformate resin **2** was collected by filtration and rinsed with CH₂Cl₂ (2 x 5 mL) and MeOH (2 x 5 mL), and dried *in vacuo*. IR (reflectance, cm⁻¹): 1700 (C=O).

Attaching Iodinated A-Ring to form resin (4)

Dichloromethane CH₂Cl₂ (5 mL) was added to resin **2** (0.048 mmol) and the vessel was allowed to shake for 30 minutes. The suspension was then cooled to 0°C and a solution of iodoanthranilic acid **3** (0.13 g, 0.48 mmol) and pyridine (40 µl) in NMP (2 mL) was added, and the vessel was allowed to shake at room temperature for 16 hours. Resin **4** was then collected by filtration, rinsed with CH₂Cl₂ (2 x 5 mL), NMP (2 x 5 mL) and MeOH (2 x 5 mL), and dried *in vacuo*. HPLC analysis after release of iodoanthranilic acid by irradiation indicated that 58% of available sites had been carbanoylated. IR (reflectance, cm⁻¹): 1750-1650 (CONH).

Attaching Pyrrolo C-Ring to from resin (6)

Dimethyl formamide DMF (5 mL) was added to resin **4** (0.036 mmol) and the vessel allowed to shake for 30 minutes. Pyrrolidine methanol **5** (40 µl, 0.36 mmol), TBTU (0.12 g, 0.36 mmol) in DMF (1 mL) and DIPEA (65 µl, 0.36 mmol) were added, and the vessel allowed to shake at room temperature for 16 hours. Resin **6** was collected by filtration, rinsed with CH₂Cl₂ (2 x 5 mL) and MeOH (2 x 5 mL), and dried *in vacuo*. IR (reflectance, cm⁻¹): 1650-1600 (C=O).

B-Ring Cyclisation to form Bead-Bound Carbinolamine (7)

Dichloromethane CH₂Cl₂ (0.5 mL) was added to resin **6** (0.024 mmol) and the vessel allowed to shake for 30 minutes. The suspension was then cooled to -10°C, and triethylamine (10 µL, 0.072 mmol) and sulphur trioxide.pyridine complex (0.012 g, 0.072 mmol) in DMSO (0.25 mL) added. Shaking was continued for 1 hour at 10°C, and the resin **7** was then collected by filtration, rinsed with CH₂Cl₂ (2 x 5 mL) and MeOH (2 x 5 mL), and dried *in vacuo*.

10 The resulting compound **7** may be cleaved from the solid support by UV light of a wavelength of 365 nm to form a compound of formula **8**.

Further synthesis steps

15 The compound of formula **7** may serve as a starting point for the synthesis of a wide variety of other compounds. The iodine at the C8 position can be reacted with a boronic acid with Pd (PPh₃)₄ as a catalyst in modified Suzuki reaction. An alternative synthesis route is to stannylate the C8 position by reacting the compound of formula **8** with Me₆Sn₂, with Pd (PPh₃)₄ as a catalyst. The stannylated compound is capable of coupling with acrylates (i.e. the Heck reaction), iodo- and bromo-arenes (i.e. the Suzuki reaction) and haloalkenes (i.e. the Stille reaction).

25 **Example 2: Synthesis of Resin-bound 7,8-Dimethoxy PBD (12) (Figure 2)**

Attaching Dimethoxy A-Ring to form Resin (10)

30 Dichloromethane CH₂Cl₂ (2 mL) was added to the choloroformate resin **2** (0.05 mmol) (prepared as in Example 1) and the vessel allowed to shake for 30 minutes. The suspension was cooled to 0°C, a solution of 4,5-dimethoxyanthranilic acid **9** (0.05 g, 0.25 mmol) and pyridine (20 µL) in NMP (2 mL) added, and the vessel allowed to shake at room temperature for 16 hours. The resin **10** was collected by filtration, and then rinsed with CH₂Cl₂ (2 x 5 mL), NMP (2 x 5 mL) and MeOH (2 x 5 mL). The entire procedure was repeated twice and the resin was then dried *in vacuo*. IR (reflectance, cm⁻¹): 1750-1650 (CONH).

Attaching Pyrrolo C-Ring to form Resin (11)

Dimethyl formamide DMF (5 mL) was added to resin **10** (0.05 mmol) and the vessel allowed to shake for 30 minutes. Pyrrolidine methanol **5** (0.025 g, 0.25 mmol), TBTU (0.08 g, 0.25 mmol) in DMF (1 mL) and DIPEA (45 μ L, 0.25 mmol) were added, and the vessel allowed to shake at room temperature for 16 hours. The resin **11** was collected by filtration, and rinsed with DMF (2 x 5 mL), NMP (2 x 5 mL) and CH_2Cl_2 (2 x 5 mL). The entire procedure was repeated twice, and the resin then dried *in vacuo*. IR (reflectance, cm^{-1}): 1700-1600 (C=O).

B-Ring Cyclisation to form Bead-Bound Carbinolamine (12)

Dichloromethane CH_2Cl_2 (1 mL) was added to resin **11** (0.05 mmol) and the vessel allowed to shake for 30 minutes. The suspension was cooled to -10°C, and triethylamine (20 μ L, 0.15 mmol) and sulphur trioxide.pyridine complex (0.024 g, 0.15 mmol) in DMSO (0.5 mL) were added. The suspension was then allowed to warm to room temperature, and the vessel was left to shake for 2 hours. The resin **12** was collected by filtration and rinsed with CH_2Cl_2 (2 x 5 mL) and MeOH (2 x 5 mL). The entire procedure was repeated twice and the resin then dried *in vacuo*.

Example 3: Alternative Synthesis of Resin-bound 7,8-Dimethoxy PBD (21) (Figures 3 & 4)25 Overall Synthetic Strategy

The on-bead oxidation step employed in the previous approaches can be avoided by coupling an anthranilic acid loaded resin to the dimethyl acetal **16** derived from proline (figure 4). In this approach, unmasking of the dimethyl acetal protected aldehyde **20** leads to spontaneous B-ring closure. Thus, exposure of the acetal **20** to a palladium catalyst ($\text{Pd}(\text{CH}_3\text{CN})_2\text{Cl}_2$) leads to the formation of the cyclized compound **21**. The acetal **20** was derived from the anthranilic acid resin **19** and the acetal **16**, which were coupled together under standard conditions. The acetal **16** was obtained from the Cbz protected compound **15** (figure 3) by hydrogenation; **15** was in turn prepared by acetalisation of the aldehyde **14**. Swern oxidation of the primary alcohol **13** afforded the aldehyde **14**, the

primary alcohol was prepared by a lithium tetrahydroborate reduction of the commercially available Cbz protected proline ester ester **12**.

5 (2S)-N-(benzoxycarbonyl)-2-hydroxymethylproline (13)

Lithium tetrahydroborate (2.6 g, 0.12 mol) was added portionwise to a solution of N-Carbonbenzyloxy-L-proline methyl ester **12** (21 g, 0.08 mol) in THF (500 mL) at 0°C. The reaction mixture was allowed to stir at room temperature for 48 hours. The solution 10 was then cooled to 0°C and ice water (150 mL) was added to quench excess lithium tetrahydroborate. The resulting suspension was adjusted to pH 4.0 with aqueous HCl (1.0 N) and extracted with Et₂O (250 mL). The organic phase was separated and washed with H₂O (3 x 100 mL), brine (2 x 100 mL), dried (MgSO₄) and concentrated 15 to give alcohol **13** as a pale yellow oil (18.6 g, 99%). ¹H NMR (270 MHz, CDCl₃) δ 2.1-1.77 (m, 4H); 3.76-3.35 (m, 4H); 4.1-3.77 (m, 1H); 5.14 (2 x s, 2H); 7.38-7.28 (m, 5H). CIMS 236 (M⁺).

20 (2S)-N-benzoxycarbonyl)pyrrolidine-2-carboxaldehyde (14)

A solution of triethylamine (32 mL, 0.23 mol) and SO₃.pyridine complex (37 g, 0.23 mol) in DMSO (210 mL) a solution of alcohol **13** (18 g, 0.077 mol) in CH₂Cl₂ (250 mL) at -10°C, under a nitrogen atmosphere. The reaction mixture was allowed to warn to room temperature and stirred for 30 minutes and then poured into ice 25 water (200 mL) and extracted with Et₂O. The organic phase was washed with aqueous HCl (1.0 N, 3 x 150 mL), H₂O (3 x 150 mL), brine (2 x 150 mL), dried (MgSO₄) and concentrated to give a yellow oil. The crude material was purified by flash column chromatography (EtOAc) to give aldehyde **14** as a colourless oil 30 (12.6 g, 71%). ¹H NMR (270 MHz, CDCl₃) δ 2.16-1.8 (m, 4H); 3.66-3.5 (m, 2H); 4.22-4.17 (m, 1H); 5.22-5.13 (m, 2H); 7.37-7.3 (m, 5H); 9.59 (2 x s, 1H). CIMS 234 (M⁺ + 1).

35 (2S)-N-(benzoxycarbonyl)pyrrolidine-2-carboxaldehyde dimethyl acetal (15)

Thionyl chloride (5.5 mL) was added to a solution of aldehyde **14** (11 g, 0.047 mol) and trimethyl orthoformate (36 mL, 0.33 mol) in MeOH (55 mL) at 0°C. The reaction mixture was heated at 60°C for

2 hours. The solution was allowed to cool to room temperature, and treated with excess solid Na₂CO₃, and diluted with Et₂O (60 mL). The suspension was filtered to remove insoluble inorganics and resultant filtrate was concentrated *in vacuo* and the redissolved in EtOAc. The organic solution was washed with saturated aqueous NaHCO₃ (3 x 50 mL), brine (2 x 50 mL), dried (MgSO₄) and concentrated to give the acetal **15** as a yellow liquid (12.5 g, 95%). ¹H NMR (270 MHz, CDCl₃) δ 2.16-17 (m, 4H); 3.64-3.33 (m, 4.02-3.91 (br. m, 1H); 4.4 and 4.6 (2 x br. s, 1H); 4.4 and 4.6 (2 x br. s, 1H); 5.17-5.1 (m, 2H); 7.47-7.28 (m, 5H).

Pyrrolidine-2-carboxaldehyde dimethyl acetal (16)

A solution of acetal **15** (5.8 g, 0.02 mol) in EtOH (50 mL) was allowed to stir for 16 hours at room temperature over Raney nickel (0.2 g), in order to remove the trace amounts of sulphur impurities prior to hydrogenation. Excess nickel was removed by filtration through Celite.

10% palladium on carbon (580 mg) was added to the alcoholic solution which was subjected to hydrogenation under pressure (c. 50 psi). After 16 hours, the reaction mixture was filtered through Celite and the pad washed with EtOAc, the combined organic solutions were concentrated to give the secondary amine **16** as a pale green liquid (2.9 g, 100%). ¹H NMR (270 MHz, CDCl₃) δ 1.93-2.59 (m, 4H); 3.1-2.92 (m, 2H); 3.4-3.3 (d, J = 6.9 Hz, 1H); 3.41 (2 x s, 6H); 3.53 (br. s, 1H); 4.2 (d, J = 6.8 Hz, 1H).

Synthesis of Resin-bound Methyl Ester **21** (Figure 4)

A suspension of hydroxyethyl-photolinker NovaSyn TG resin **17** (0.114 g, 0.24 mmol/g loading) in CH₂Cl₂ (1 mL) in a vessel fitted with a sinter was shaken for 30 minutes. The suspension was cooled to 0°C, before addition of a solution of triphosgene (0.04 g, 0.14 mmol) and pyridine (11 mL, 0.14 mmol) in CH₂Cl₂ (0.5 mL). The vessel was allowed to shake at room temperature for 16 hours. The resin **18** was filtered and rinsed with CH₂Cl₂ (2 x 2 mL) NMP (2 x 2 mL) and CH₂Cl₂ (2 x 2 mL). This procedure was repeated twice and the resin was then dried *in vacuo*.

A suspension of resin **18** (0.027 mmol) in CH₂Cl₂ (1 mL) was allowed to shake for 30 mins. The suspension was cooled to 0°C and a solution of 4,5-dimethoxy-antrhanilic acid **8** (0.03 g, 0.14 mmol) and pyridine (10 mL) in NMP (0.5 mL) was added. The vessel was 5 allowed to shake at room temperature for 16 hours.

Resin **19** was filtered and rinsed with CH₂Cl₂ (2 x 2 mL), NMP (2 x 2 mL) and MeOH (2 x 2 mL). The procedure was repeated twice and then the resin was dried *in vacuo*.

10 A suspension of resin **19** (0.027 mmol) in DMF (1 mL) was allowed to shake for 30 minutes. To this suspension was added the acetal **16** (20 mg, 0.14 mmol), TBTU (43 mg, 0.14 mmol) and DIPEA (25 mL, 0.144 mmol) in DMF (0.5 mL). The vessel was allowed to shake at 15 room temperature for 2 hours after which time the resin **20** was filtered and rinsed with DMF (2 x 1 mL), CH₂Cl₂ (2 x 1 mL) and MeOH (2 x 1 mL). The procedure was repeated twice and then the resin was dried *in vacuo*.

20 A suspension of resin **20** (0.027 mmol) in acetone (0.5 mL) was allowed to shake for 30 minutes. To this suspension was added PdCl₂(CH₃CN)₂ (7 mg, 0.027 mmol) in acetone (0.4 mL) and the vessel was allowed to shake at room temperature for 2 hours. The resulting resin **21** was filtered and rinsed with acetone (2 x 1 25 mL), CH₂Cl₂ (2 x 1 mL) and MeOH (2 x 1 mL). The procedure was repeated twice and then the resin was dried *in vacuo*.

Example 4: Further Alternative Synthesis of 7,8-Dimethoxy PBD (13) (Figure 5)

30 **Overall Synthetic Strategy**

This synthesis used the on-bead oxidation step of example 1 and 2 to obtain the resin-bound PBD **34**, but using the Dess Martin reagent and Swern oxidation. The resin used to bind the required anthranilic acid **31** is p-nitrophenyl carbonate Wang resin, which 35 can directly couple the anthranilic acid without the need for interactive transformation to the chloroformate and thus eliminating a process step.

Synthesis Route

A suspension of *p*-nitrophenyl carbamate Wang resin **31** (1 g, 0.93 mmol/g loading) in CH₂Cl₂/DMF (2:1, 10 mL) was shaken for 30 minutes. A solution of dimethoxyanthranilic acid **9** (0.92 g, 4.7 mmol), HOBT (0.37 g, 2.8 mmol) and DIPEA (0.97 mL, 5.5 mmol) in CH₂Cl₂/DMF (2:1, 20 mL) was added to the swollen resin. The vessel was allowed to shake at room temperature for 6 hours. Resin **32** was filtered and rinsed with DMF (2 x 10 mL), CH₂Cl₂ (2 x 10 mL), MeOH (2 x 10 mL), Et₂O (10 mL) and dried *in vacuo*.

10

A suspension of resin **32** (0.93 mmol) in DMF (10 mL) was allowed to shake for 30 minutes. A solution of pyrrolidine methanol **5** (0.47 g, 4.7 mmol), TBTU (1.5 g, 4.7 mmol) and DIPEA (0.81 mL, 4.7 mmol) in DMF (10 mL) was added to the swollen resin. The vessel was allowed to shake at room temperature for 6 hours. Resin **33** was filtered and rinsed with DMF (2 x 10 mL), CH₂Cl₂ (2 x 10 mL), MeOH (2 x 10 mL), Et₂O (10 mL) and dried *in vacuo*. This entire procedure was repeated once.

15

A suspension of resin **33** (0.93 mmol) in CH₂Cl₂ (10 mL) was allowed to shake for 30min. A solution of Dess Martin periodinane (1.97 g, 4.7 mmol) in CH₂Cl₂ (20 mL) was added to the swollen resin. The vessel was allowed to shake at room temperature for 2 hours. Resin **34** was filtered and rinsed with CH₂Cl₂ (2 x 10 mL), MeOH (2 x 10 mL), Et₂O (10 mL) and dried *in vacuo*.

20

A suspension of resin **34** (0.93 mmol) in TFA/CH₂Cl₂ (20 mL) was allowed to shake for 2 hours. The resultant red solution was decanted off and the procedure was repeated on the remaining resin, to ensure complete cleavage. The combined organic solution was diluted with water (20 mL) and carefully neutralised to pH 7.0 by the addition of solid sodium bicarbonate. The organic phase was separated and washed with H₂O (3 x 20 mL), brine (2 x 20 mL), dried (MgSO₄) and concentrated to give a red film. The crude material was purified by flash column chromatography (silica gel, 1 % MeOH/CHCl₃) to give imine **13**, as a beige solid (142 mg, 59%).

¹H NMR (270 MHz, CDCl₃) δ 2.4-1.26 (m, 6H), 3.9-3.82 (m, 1H), 3.96

30

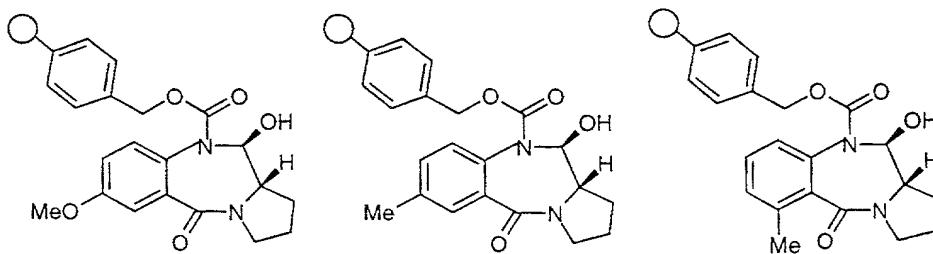

and 3.93 (2 x s, 6H), 6.81 (s, 1H), 7.52 (s, 1H), 7.69-7.67 (d, J = 4.2 Hz, 1H); ^{13}C NMR (68.7 MHz, CDCl_3) δ 24.2, 29.4, 38.7, 46.7, 53.7, 56.4, 109.4, 111.3, 120.3, 140.7, 147.5, 151.3, 162.5, 164.6.

5 Alternative Oxidation method:

A suspension of resin **33** (0.6 mmol) in CH_2Cl_2 (10 mL) was allowed to shake for 30min. A solution of SO_3 -pyridine complex (0.96 g, 6 mmol) and triethylamine (5 mL, 0.036 mol) in DMSO (5 mL) was added to the swollen resin. The vessel was allowed to shake at room temperature for 3 hours. Resin **34** was filtered and rinsed with CH_2Cl_2 (2 x 10 mL), MeOH (2 x 10 mL), Et_2O (10 mL) and dried *in vacuo*.

A suspension of resin **34** (0.6 mmol) in TFA/ CH_2Cl_2 (1:1, 20 mL) was allowed to shake for 3 hours. The resultant red solution was decanted off and was diluted with water (20 mL) and carefully neutralised to pH 7.0 by the addition of solid sodium bicarbonate. The organic phase was separated and washed with H_2O (3 x 20 mL), brine (2 x 20 mL), dried (MgSO_4) and concentrated to give a luminous yellow oil. The crude material was purified by flash column chromatography (silica gel, 5 % MeOH/ CHCl_3) to give imine **13**, as a yellow film (60 mg, 38%) (NHR as above).

Example 5: Synthesis of three resin bound PBDS (52, 53, 54)

52

53

54

25 Compounds **52** and **53** were synthesised in the same way as example 4, using the alternative oxidation method (Swern) starting from the appropriate anthranilic acids (**52**: 5-methoxyanthranilic acid; **53**: 5-methylanthranilic acid). Compound **54** was synthesised in the same way as example 4 using the first oxidation method (Dess Martin)

starting from 6-methylanthranilic acid. The EIMS ($M+H$)⁺ results for the compounds, after cleavage from the solid support, were: **52** - 230; **53** - 214; **54** - 215.

5 **Example 6: Cleavage of PBDs from beads**

HPLC Method

Assays of the PBDs synthesised in example 2 were carried out on a reversed-phase 25cm x 4.6mm (inside diameter) C4 (Nucleosil™; 5μm bead size) column protected with a Delta-Pak™ C4, 300Å Guard pre-column. Elution was carried out using a mobile phase consisting of MeOH/H₂O (1:1) at a flow rate of 1mL/min. A Waters 490E multiwavelength detector was used. Peak identification was accomplished by reference to an authentic sample of compound **13** synthesized "off-bead".

15

Conditions

INJECTION VOLUME:	20μL
FLOW RATE:	1mL/min
MOBILE PHASE:	50% METHANOL/50% WATER
20 STATIONARY PHASE:	C4, 5μm (REVERSED PHASE)
COLUMN:	WATERS 300Å
DETECTOR:	254nm
RUN TIME:	20mins

25 Cleavage of the PBD from beads following UVA irradiation was monitored by HPLC. The resin-bound compound **12** (JMB 98) at a concentration of 1mM in DMF was UVA irradiated. At appropriate time intervals, samples were centrifuged to pellet the beads and the amount of free PBD released into the supernatant determined by HPLC.
30 After photolysis of resin **12**, carbinolamine **13** was the only species produced as determined by reference to an authentic sample of compound **13** synthesised "off bead". Typical HPLC traces of authentic **13** and of the PBD cleaved from resin **12** with increasing irradiation times are shown in Figure 6, and the percentage cleavage with time shown in Figure 7. Cleavage occurred linearly with time, and complete cleavage was achieved by 2 hours under the conditions used. HPLC studies indicated that 77% of the sites on the beads had reacted.

*In Vitro Cytotoxicity Assay*MTT Assay Method

The ability of agents to inhibit the growth of chronic human histiocytic leukaemia U937 cells or human chronic myeloid leukaemia

5 K562 cells in culture was measured using the MTT assay (Mosmann, 1983). This assay is based on the ability of viable cells to reduce a yellow soluble tetrazolium salt, 3-(4,5-dimethylthiazolyl)-2,5-diphenyltetrazolium bromide (MTT; Sigma Chemical Co.), to an insoluble purple formazan precipitate. Cells at a density of 5 x 10⁴

10 cells/mL were continuously incubated with the test compounds at a final concentration of 0.3 μ M. Aliquots of each of the compounds of

the 27-member library were either left without UVA (365 nm) exposure or were exposed to UVA (365 nm) for 2 hours prior to their addition to the cell suspension. Following drug treatment, the cells were

15 transferred to 96-well microtitre plates, 10⁴ cells per well, 8 wells per sample. The plates were incubated at 37°C in a humidified atmosphere containing 5% CO₂. Following incubation of the plates for

4 days (to allow control cells to increase in number 10-fold), 20 μ L of a 5mg/mL solution of MTT in phosphate-buffered saline was added to each well and the plates further incubated for 5 hours. The plates were then centrifuged for 5 minutes at 300g, and the bulk of

20 the medium removed from the cell pellet, leaving 10-20 μ L per well. DMSO (200 μ L) was added to each well, and the samples agitated to ensure complete mixing. The optical density was then read at a

25 wavelength of 550nm using a Titertek Multiscan ELISA plate reader and the dose-response curve constructed. The IC₅₀ value was read as the dose required to reduce the final optical density to 50% of the control value.

30 Results

The cytotoxicity of the PBD released from resin **12** following irradiation was determined using the MTT assay. The survival curve resulting from the compound released from **12** (JMB 98) following 2 and

35 5 hours irradiation was consistent with that of authentic **13** (AG 105); see figure 8. The released PBD therefore has full biological activity.

Example 7: Synthesis of a resin-bound 8-aminopropyl PBD scaffold (30) (see Figure 9)

Overall Synthetic Strategy

The o-nitrobenzylchloroformate resin **2** can also immobilize more complicated amines other than simple anthranilic acids, greatly facilitating the preparation of molecules such as the PBD C8-amino scaffold **30**. As in the previous strategy, the Fmoc protected scaffold **29** was prepared by oxidizing the primary alcohol resin **28**. This resin was obtained by loading the o-nitrobenzylchloroformate resin **2** with the amino alcohol **27**. The amino alcohol was prepared by a Tin (II) chloride mediated reduction of the nitro alcohol **26**; use of hydrogenation conditions to reduce the nitro group were avoided due to the presence of the Fmoc group in **26**. The nitro alcohol in turn was furnished in this case by coupling pyrrolidine methanol **5** to the o-nitrobenzoic acid **25**, although other functionalised prolines could also be employed in the coupling reaction. The Fmoc o-nitrobenzoic acid was obtained via Fmoc protection of the amino acid **24** produced by hydrolysis of the ester **23**. Other nitrogen protecting groups may be substituted for Fmoc as long as the cleavage conditions involved are compatible with the presence of an o-nitrobenzyl carbamate linker (eg. Boc, Alloc, Teoc etc). Finally, the amino ester was prepared by nitration of **22** which was obtained by a Mitsunobu etherification of commercially available methyl vanillate.

25

Boc Amino Ester (22)

A solution diethylazidodicarboxylate (3.38 g, 19.4 mmol) in THF (50 mL) was added dropwise to a solution of methylvanillate (3.53 g, 19.4 mmol), N-Boc-propanolamine (3.4 g, 19.4 mmol) and triphenylphosphine (5.09 g, 19.4 mmol) in THF (50 mL) at 0°C. The reaction mixture was allowed to warm to room temperature and stir overnight. Excess solvent was removed by rotary evaporation under reduced pressure and the residue triturated with toluene. Precipitated triphenylphosphine oxide was removed by vacuum filtration and the filtrate concentrated in vacuo. The residue was subjected to flash column chromatography (silica gel, petroleum ether 40 - 60/ethyl acetate, 80/20) and removal of excess eluent afforded the pure product **22** (4.8 g, 73 %

yield.). ^1H NMR (270 MHz, CDCl_3) δ 7.65 (dd, $J = 8.43, 2.02$ Hz, 1H), 7.54 (d, $J = 2.02$ Hz, 1H), 6.86 (d, $J = 8.43$ Hz, 1H), 5.55 (bs, 1H), 4.15 (t, $J = 5.87$ Hz, 2H), 3.93 (s, 3H), 3.90 (s, 3H), 3.41-3.35 (m, 2H), 2.09-2.00 (m, 2H) and 1.46 (s, 9H). ^{13}C NMR (68.7 MHz, CDCl_3) δ 166.9, 156.1, 152.1, 148.8, 123.5, 122.8, 112.0, 111.2, 79.0, 68.2, 55.9, 52.0, 38.9, 29.2 and 28.5.

Amino Nitro Ester (23)

The Boc-protected amine **22** (10 g) was added portionwise to cold nitric acid (30 mL, 70%, ice bath), the reaction mixture was allowed warm to room temperature and stir overnight. The reaction mixture was poured onto crushed ice (100 g) and the resulting aqueous solution reduced to half its original volume by rotary evaporation under reduced pressure. The resulting precipitate was collected by vacuum filtration and recrystallised from absolute ethanol to afford the product as a yellow crystalline solid **23** (8.9 g, 87%). ^1H NMR (270 MHz, CDCl_3) δ 7.47 (s, 1H), 7.08 (s, 1H), 4.24 (t, $J = 5.86$ Hz, 2H), 3.96, (s, 3H), 3.89 (s, 3H), 3.24 (t, $J = 6.78$, 2H) and 2.32-2.23 (m, 2H).

20

Amino Nitro Acid (24)

A solution of potassium hydroxide (0.5 g, 8.7 mmol) and the nitrobenzoic acid **23** (1 g, 2.9 mmol) in aqueous methanol (H_2O , 10 mL; methanol, 20 mL) was allowed to stir at room temperature for 1 hour and then heated at reflux until TLC (AcOEt, MeOH, TEA, 1:10:100) revealed the complete consumption of starting material. Excess methanol was removed by rotary evaporation and the residual solution diluted with water and neutralised with 1N HCl. The neutralised aqueous solution was used directly, without further purification, in the next synthetic step.

Fmoc Nitro Acid (25)

Fluorenylmethyl chloroformate (0.78 g, 3 mmol) was added portionwise to the aqueous solution from the previous reaction which had been diluted with THF (50 mL) and aqueous sodium carbonate (2.15 g, 50 mL water). The reaction mixture was then allowed to stir overnight. Excess organic solvent was removed by rotary evaporation under reduced pressure from the reaction mixture, the residual aqueous

solution was then washed with ethyl acetate (3 x 20 mL) (to remove excess Fmoc-Cl). The aqueous phase was acidified with conc. HCl and extracted with ethyl acetate (2 x 50 mL). The organic phase was dried over magnesium sulphate, filtered and evaporated *in vacuo* to afford the product **25** (1 g, 70% yield). ^1H NMR (270 MHz, CDCl_3) δ (Rotamers) 8.21 (bs, 2H), 7.73 (d, J = 7.14 Hz, 2H), 7.59 (d, J = 7.33 Hz, 2H) 7.40 - 7.13 (m, 5H), 6.47 and 5.70 (2 x bs, 1H), 4.54-3.88 (m, 5H), 3.77 (s, 3H), 3.44-3.42 (m, 2H) and 2.04-1.90 (m, 2H). ^{13}C NMR (68.7 MHz, CDCl_3) δ 168.7, 156.9, 152.1, 149.8, 143.7, 141.9, 141.3, 127.7, 127.0, 124.9, 120.6, 120.0, 111.1, 107.8, 68.5, 66.4, 56.4, 47.3, 39.1 and 28.4.

Fmoc Nitro Alcohol (**26**)

A catalytic amount of DMF (2 drops) was added to a solution of the acid **25** (1.16 g, 2.36 mmol) and oxalyl chloride (0.33 g, 2.6 mmol) in dry dichloromethane (20 mL) and the reaction mixture was allowed to stir overnight. The resulting acid chloride solution was cooled to 0°C and treated dropwise with a solution of pyrrolidinemethanol (0.26 g, 2.57 mmol) and triethylamine (0.52 g, 5.14 mmol) in dry dichloromethane (15 mL). Thin layer chromatography, performed shortly after the end of the addition of amine, revealed that reaction had gone to completion. The reaction mixture was washed with HCl (1N, 1 x 50 mL) and water (2 x 20 mL) and dried over magnesium sulphate. Removal of excess solvent afforded the crude product which was subjected to flash column chromatography (silica gel, gradient elution, 1% methanol in chloroform to 2% methanol in chloroform) to afford the required amide **26** (1.1 g, 81%). ^1H NMR (270 MHz, CDCl_3) δ 7.75 (d, J = 7.33 Hz, 2H), 7.67 (s, 1H), 7.60 (d, J = 6.96 Hz, 2H), 7.41-7.26 (m, 4H), 6.78 (s, 1H), 5.66 (bs, 1H), 4.48-4.39 (m, 3H), 4.23-4.13 (m, 3H), 3.91-3.79 (m, 5H), 3.45-3.42 (m, 2H), 3.18-3.13 (m, 2H) and 2.08-1.70 (m, 6H). ^{13}C NMR (68.7 MHz, CDCl_3) δ 168.5, 156.5, 154.7, 148.2, 143.9, 141.3, 137.0, 128.0, 127.7, 127.0, 124.9, 120, 108.9, 108.0, 68.4, 66.2, 66.0, 61.5, 56.6, 53.5, 47.3, 39.0, 28.9, 28.4 and 24.4.

Fmoc Amino Alcohol (**27**)

A solution of the nitroamide **26** (3 g, 5.22 mmol) and $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$ (6.15 g, 27.15 mmol) in methanol (60 mL) was heated at reflux for 2 hours.

The reaction mixture was concentrated to 1/3 of its original volume and carefully treated with saturated aqueous sodium bicarbonate solution (vigorous effervescence!) until pH8 was obtained. The mixture was allowed to stir vigorously with ethyl acetate (100 mL) overnight and then filtered through celite to remove precipitated tin salts. The aqueous phase was extracted with ethyl acetate (50 mL) and the combined organic phase was dried over magnesium sulphate. Removal of excess solvent afforded the desired amine as a dark yellow oil **27** (1.93 g, 68%). ^1H NMR (270 MHz, CDCl_3) δ 7.75 (d, $J = 7.51$ Hz, 2H), 7.61 (d, $J = 7.33$ Hz, 2H), 7.40-7.26 (m, 4H), 6.72 (s, 1H), 6.25 (s, 1H), 5.95 (bs, 1H), 4.43-4.04 (m, 6H), 3.67-3.42 (m, 9H) and 2.11-1.7 (m, 6H). ^{13}C NMR (68.7 MHz, CDCl_3) δ 171.7, 156.6, 150.8, 144.0, 141.3, 140.6, 127.6, 127.0, 125.0, 119.9, 112.0, 102.2, 68.0, 66.6, 66.4, 61.0, 56.6, 51.0, 47.3, 39.5, 29.1, 28.5 and 24.9.

15

Resin-bound amino-alcohol (28)

The o-nitrobenzylchloroformate resin (0.048 mmol) was allowed to swell for 10 minutes in dry dichloromethane (5 mL). A solution of the amino alcohol (0.13 mg, 0.24 mmol) and pyridine (0.02 g) in dry dichloromethane (1 mL) was added to the resin suspension under a nitrogen atmosphere at 0°C. The reaction mixture was then allowed to shake overnight at room temperature. Excess reagent was removed by suction and the resin washed with dichloromethane (2 x 5 mL) and methanol (2 x 5 mL) and then dried *in vacuo* overnight. The procedure was repeated three times to ensure complete reaction.

Resin-bound Fmoc-aminopropyl PBD (29)

The carbamate resin (0.048 mmol) prepared in the previous reaction was allowed to swell in dry dichloromethane (1 mL) for 10 minutes. The suspension was cooled to -10°C and treated successively with triethylamine (20 μL , 0.144 mmol) and pyridine sulphur trioxide complex (0.023 g, 0.144 mmol) in dimethyl sulphoxide (0.5 mL) at -10°C and the suspension was allowed to shake at -10°C for two hours. Excess reagent was removed by suction and the resin washed with methanol (2 x 5 mL) and dichloromethane (2 x 5 mL) and then dried *in vacuo* overnight. The procedure was repeated three times to ensure complete reaction.

Resin-bound Aminopropyl PBD (30)

The resin-bound 8-aminopropyl PBD **30** is prepared from the Fmoc-protected form **29** by standard deprotection conditions. This compound **30** can be used to form compounds according to the second aspect of 5 the present invention, by reaction of appropriate combinatorial units from those described above with this compound.

Example 8: Synthesis of resin bound 8-allyl ester protected acid PBD scaffold (39) (see Figure 10)

10 The resin bound PBD **39** was synthesised following the strategy used in Example 4.

Synthesis of Amine 37

15 The nitro acid **35** was derived from the alcohol **35a** by the following two steps.

The alcohol **35a** (50 g, 0.22 mol) was added portionwise over 1 hour 20 to nitric acid (70%, 400 ml) cooled to 0°C. Once addition was complete, the solution was stirred at 0°C for 1 hour, then allowed to warm to room temperature. The semisolid formed was collected by filtration and washed with a minimum of ice/water. The resulting pale yellow solid was redissolved in EtOAc, the solution dried (MgSO_4) and then concentrated to afford the diacid **35b** (31 g, 49%).
 ^1H NMR (270 MHZ): δ 2.83-2.79 (t, $J = 6$, 12.5 Hz, 2H), 3.94 (s, 3H), 25 4.37-4.33 (t, $J = 6$, 12.5 Hz, 2H), 7.18 (s, 1H), 7.46 (s, 1H), 10.38 (br.s, 2H).

A mixture of the diacid **35b** (20 g, 74.3 mmol) and *p*-toluene sulphonic acid monohydrate (2.3 g, 7.4 mmol) in allyl alcohol (240 mL, 3.5 mol) 30 was refluxed for 7 hours then allowed to cool. The allyl alcohol was then removed *in vacuo*, and the residue triturated with dilute HCl acid (3 x 75 ml) and collected by filtration. This solid was taken up in EtOAc, and the resulting solution washed with water (3 x 50 ml) and brine (3 x 50 ml) and dried over sodium sulphate. Evaporation 35 *in vacuo* afforded **35** as a white solid (19.27 g, 84%): mp 128-130°C; $^1\text{H-NMR}$ (270 MHZ, CDCl_3) δ 2.92 (t, 2H, $J = 6.35$ Hz); 3.94 (s, 3H); 4.38 (t, 2H, $J = 6.41$ Hz); 4.65 (d, 2H, $J = 5.61$ Hz); 5.27 (dd, 1H, $J_1 = 1.28$ Hz, $J_2 = 19.42$ Hz); 5.33 (dd, 1H, $J_1 = 1.28$ Hz, $J_2 = 17.04$

Hz); 5.92 (m, 1H); 7.15 (s, 1H); 7.45 (s, 1H); ^{13}C NMR (67.8 MHZ, CDCl₃): δ 34.1, 56.5, 65.0, 65.4, 108.5, 111.3, 118.3, 122.9, 131.8, 141.1, 149.1, 152.6, 167.1, 170.0; IR (Nujol): ν 1730, 1630, 1550, 1430, 1390, 1290, 1230, 1190, 1170, 1070, 1030, 1010 cm⁻¹; MS (EI) m/z (relative intensity): 325 (M⁺, 19), 251 (3), 213 (2), 196 (3), 211 (3), 113 (19), 91 (4), 71 (9), 55 (6); HRMS: calcd. for C₁₄H₁₅NO₈ 325.0798, found 323.0773.

To a suspension of the nitro acid **35** (5 g, 0.015 mol) in CH₂Cl₂ (75 ml) was added oxalyl chloride (1.5 ml, 0.017 mol) and DMF (0.05 ml) in a dropwise manner and the resulting solution was stirred for 16 hours. The acid chloride was then added dropwise to a stirring solution of pyrrolidine methanol (1.7 g, 0.017 mol) and triethylamine (4.7 ml, 0.034 mol) in CH₂Cl₂ (40 ml) at -20°C (liquid N₂/acetone). This solution was stirred at room temperature for 16 hours. The reaction was quenched with aqueous HCl (1.0 N, 25 ml) and the organic extracts were washed with H₂O and brine, dried and concentrated to give the crude yellow oil. The material was purified by column chromatography (5% MeOH/CHCl₃), to give **36** as a pale yellow oil (6.2 g, 100%). ^1H NMR (270 MHz, CDCl₃) δ 2.22-1.71 (m, 6H); 2.94 (t, J = 6.4 Hz, 2H); 3.15 (d x d, J = 6.5 Hz, 2H); 3.92-3.76 (m, 1H); 3.96 (s, 3H); 4.4 (t, J = 6.2 Hz, 2H); 4.67-4.64 (m, 2H); 5.39-5.23 (m, 2H); 6.0-5.86 (m, 1H); 6.81 (s, 1H); 7.75 (s, 1H).

To a stirring solution of the nitro compound **36** (6 g, 0.015 mol) in MeOH (80 ml) was added SnCl₂.2H₂O (16.6 g, 0.074 mol) and heated at reflux for 45 minutes. The reaction was concentrated in vacuo and the residual oil was partitioned between EtOAc and aqueous saturated NaHCO₃ and stirred vigorously for 16 hours to aid separation. This material was filtered through Celite and extracted with EtOAc, washed with H₂O and brine, dried and concentrated to give amine **37** as a yellow oil (3.3 g, 59%). ^1H NMR (270 MHz, CDCl₃) δ 2.17-1.65 (m, 6H); 2.9 (t, J = 6.6 Hz, 2H); 3.72-3.46 (m, 3H); 3.75 (s, 3H); 4.2 (t, J = 6.8 Hz, 2H); 4.4 (br. d x d, J = 9.7 Hz, 2H); 4.65-4.62 (m, 2H); 5.37-5.22 (m, 2H); 6.0-5.85 (m, 1H); 6.3 (s, 1H); 6.76 (s, 1H).

Synthesis of PBD Scaffold **39**

A suspension of *p*-nitrophenyl carbamate Wang resin **31** (1 g, 0.6

mmol/g loading) in CH₂Cl₂/DMF (2:1, 15 ml) was shaken for 30 minutes. A solution of amine **37** (1.13 g, 3 mmol), HOBr (0.24 g, 1.8 mmol) and DIPEA (0.63 ml, 3.6 mmol) in CH₂Cl₂/DMF (2:1, 15 ml) was added to the swollen resin. The vessel was allowed to shake at room temperature for 6 hours. Resin **38** was filtered and rinsed with DMF (2 x 10 ml), CH₂Cl₂ (2 x 10 ml), MeOH (2 x 10 ml), Et₂O (10 ml) and dried in vacuo.

A suspension of resin **38** (0.6 mmol) in CH₂Cl₂ (10 ml) was allowed to shake for 30min. A solution of Dess Martin periodinane (1.27 g, 3 mmol) in CH₂Cl₂ (20 ml) was added to the swollen resin. The vessel was allowed to shake at room temperature for 2 hours. Resin **39** was filtered and rinsed with CH₂Cl₂ (2 x 10 ml), MeOH (2 x 10 ml), Et₂O (10 ml) and dried in vacuo.

15

This scaffold **39** could be used in combinatorial chemistry by deprotection of the acid group using Pd(PPh₃)₄ in chloroform, acetic acid and n-methyl morpholine.

20

A suspension of resin **39** (0.6 mmol) in TFA/CH₂Cl₂ (1:1, 30 ml) was allowed to shake for 2 hours. The resultant red solution was decanted off and was diluted with water (20 ml) and carefully neutralised to pH 7.0 by the addition of solid sodium bicarbonate. The organic phase was separated and washed with H₂O (3 x 20 ml), brine (2 x 20 ml), dried (MgSO₄) and concentrated to give a brown foam **40** (0.09 g, 42%). EIMS 358 (M + 1)⁺

30

Example 9: Synthesis of an aminopropoxy PBD Scaffold (50) (See Figure 11)

Overall Synthesis Strategy

The on-bead (p-nitrophenyl Wang resin) ring closure (49-50) was carried out using a Dess Martin reagent as in Example 4. The final step (production of the off-bead PBD), was carried out to prove that the on-bead resin was of the desired structure.

Synthesis of N-(tert-butoxycarbonyl)-3-hydroxypropylamine 42

A solution of (Boc)₂O (25.0 g, 114.5 mmol) in anhydrous DCM (50 mL) was added dropwise to a stirred solution of 3-amino-1-propanol **41** (7.8 g, 104.5 mmol) in anhydrous DCM (100 mL), under a nitrogen atmosphere. The reaction mixture was allowed to stir for 12 hours, after which time TLC (50% pet-ether/EtOAc) revealed complete loss of starting material. The solution was diluted with Et₂O (150 mL) and washed with phosphate buffer (0.5 M, pH 5.4, 2 x 70 mL), sat. aqueous NaHCO₃ (70 mL), brine (2 x 70 mL) and dried over MgSO₄. Excess solvent was removed by evaporation under reduced pressure to give a viscous colourless oil (18.3 g, 100%).

¹H NMR (270 MHz, CDCl₃): δ 1.44 (s, 9H, CH₃), 1.67 (m, 2H, H2'), 3.26 (q, 2H, J = 6.23 Hz, H3'), 3.65 (dd, 2H, J = 5.86, 5.68 Hz, H1'), 3.78 (dt, 1H, J = 6.04, 5.87 Hz, OH), 5.18 (br, 1H, NH); ¹³C NMR (67.8 MHz, CDCl₃): δ 28.4 (CH₃), 32.6 (C2'), 37.1 (C3'), 59.3 (C1'), 79.4 (C_{quater}), 157.1 (C=O); MS (E/I) m/z (relative intensity): 176 (M⁺, 30), 120 (100), 119 (31), 102 (49), 83 (33), 76 (67), 74 (36); HRMS (E/I) exact mass calcd for C₈H₁₇O₃N: m/e 175.1200, obsd m/e 175.1208; IR (Nujol) v: (cm⁻¹) 3355, 2976, 2936, 2878, 1810, 1694, 1531, 1455, 1392, 1366, 1278, 1253, 1173, 1072, 996, 914, 870, 781, 752, 638.

Synthesis of Methyl 4-[N-(tert-butoxycarbonyl)] aminopropoxy-3-methoxybenzoate 44

A solution of DEAD (18.3 g, 105.3 mmol) in freshly distilled THF (50 ml) was added dropwise to a mechanically stirred solution of triphenylphosphine (27.6 g, 105.3 mmol), methyl vanillate **43** (19.2 g, 105.3 mmol), and Boc-amino-1-propanol **42** (18.4 g, 105.3 mmol) in freshly distilled THF (250 mL), at 0°C under a nitrogen atmosphere. Following the addition of DEAD the reaction mixture was allowed to stir at room temperature overnight and the progress of reaction was monitored by TLC (50% EtOAc/pet-ether). The solvent was removed by evaporation under reduced pressure and the residue was triturated with Et₂O (300 mL). This led to the precipitation of some of the TPO and diethyl hydrazinedicarboxylate which were removed by filtration and the filtrate was washed with 1 N aqueous NaOH (150 mL), H₂O (2 x 150 mL), brine (2 x 150 mL) and dried over MgSO₄. Excess solvent

was removed by evaporation under reduced pressure. The title compound was purified by column chromatography (80% pet-ether/EtOAc) to give a beige solid (30 g, 85 %).

mp = 79-82 °C; ¹H-NMR (CDCl₃, 270 MHz): δ 1.46 (s, 9H, CH₃), 2.0-2.08 (m, 2H, H2'), 3.38 (dd, 2H, J = 5.68, 6.04 Hz H3'), 3.90 (s, 3H, OCH₃_{ester}), 3.93 (s, 3H, OCH₃_{ether}), 4.14 (t, 2H, J = 5.95 Hz, H3'), 5.58 (br, 1H, NH), 6.86 (d, 1H, J = 8.42 Hz, H5), 7.55 (d, 1H, J = 1.83 Hz, H2), 7.65 (dd, 1H, J = 2.02, 8.42 Hz, H6); ¹³C-NMR (CDCl₃, 68.7 MHz): δ 28.5 (C), 29.2 (C2'), 38.9 (C3'), 52.0 (OCH₃_{ester}), 55.8 (OCH₃_{ether}), 68.1 (C1'), 78.9 (C_{quater}), 111.3 (C5), 112.0 (C2), 122.84 (C_{arom}), 123.5 (C6), 148.8 (C_{arom}), 152.1 (C_{arom}), 156.1 (NC=O), 166.8 (C=O); MS (E/I) m/z (relative intensity): 339 (M⁺, 11), 266 (13), 182 (42), 151 (27), 102 (100); HRMS (E/I) exact mass calcd. for C₁₇H₂₅NO₆: m/e 339.1682, obsd m/e 339.1733; IR (Nujol) ν: (cm⁻¹) 3362, 2923, 2854, 1712, 1684, 1599, 1520, 1464, 1377, 1272, 1217, 1132, 1045, 1022, 872, 780, 762, 722.

Synthesis of Methyl 4-Aminopropoxy-5-methoxy-2-nitrobenzoate 45

The ester **44** (4.0 g, 11.8 mmol) was added in small portions to a stirred solution of 70% HNO₃ (2 mL acid/g of substrate) at room temperature and the reaction mixture was allowed to stir overnight. TLC (CHCl₃) at this point revealed the complete loss of starting material. The reaction mixture was cooled on ice bath, and 15 g of iced water was added, precipitating the product. The precipitate was collected by vacuum filtration and washed with small amount of iced water. The filtrate was cooled and a second crop of precipitate was collected by vacuum filtration and washed with iced water. The combined precipitate was dried *in vacuo* to provide the title compound **45** as a yellow solid, which was not purified further, but used directly in the subsequent reaction (2.3 g, 70%).

mp = 101-103 °C; ¹H-NMR (CDCl₃/DMSO-d₆, 270 MHz): δ 2.31 (m, 2H, H2'), 3.20 (br, 2H, H3'), 3.95 (s, 3H, OCH₃ ether), 3.98 (s, 3H, OCH₃_{ester}), 4.24 (t, 2H, J = 5.95 Hz, H1'), 7.11 (s, 1H, H6), 7.49 (s, 1H, H3), 8.21 (s, 3H, NH); ¹³C-NMR (CDCl₃, 68.7 MHz): δ 26.5 (C2'), 37.0 (C3'), 53.0 (OCH₃_{ester}), 56.0 (OCH₃_{ether}), 66.7 (C1'), 108.3 (C3), 111.0 (C6),

121.6 (C_{arom}), 140.9 (C2), 149.3 (C_{arom}), 152.6 (C_{arom}), 166.8 (C=O); **MS** (E/I) m/z (relative intensity): 284 (M^{+} , 90), 237 (70), 227 (93), 196 (47), 181 (38), 137 (100), 122 (81), 93 (52), 79 (44); **HRMS** (E/I) exact mass calcd. for $C_{12}H_{17}N_2O_6$: m/e 284.1008, obsd m/e 284.1018; **IR** (Nujol) ν : (cm^{-1}) 3472, 2937, 2911, 2855, 1733, 1532, 1516, 1462, 1377, 1292, 1224, 1143, 1052, 884, 812, 792, 773, 756, 724, 646.

Synthesis of Methyl 4-(N-9-fluorenylmethoxycarbonyl)aminopropylxyloxy-5-methoxy-2-nitrobenzoic acid 46

10 A solution of **45** (3.9 g, 11.2 mmol) and KOH (1.9 g, 33.4 mmol) in aqueous methanol (77 mL MeOH, 15 mL H_2O) was heated at reflux for 90 minutes. At which time TLC (EtOAc/MeOH/TEA 100:10:1) revealed complete consumption of starting material. Excess MeOH was removed by evaporation under reduced pressure and the concentrate diluted with H_2O (20 mL). The aqueous solution was neutralised with conc. HCl, diluted with THF (100 mL) and sodium carbonate (2.9 g, 27.9 mmol) was added to adjust the solution to pH 9. After this, fluorenylmethyl chloroformate (3.0 g, 11.6 mmol) was added portionwise over 30 minutes and the reaction mixture was allowed to stir for 12 hours. Excess THF was removed by evaporation under reduced pressure and the aqueous fraction was extracted with EtOAc (3 x 100 mL) to remove free Fmoc, and then acidified with conc. HCl and extracted again with EtOAc (3 x 100 mL). The organic phase was washed with H_2O (2 x 100 mL), brine (100 mL), dried over $MgSO_4$, and excess solvent was removed by evaporation under reduced pressure to afford **46** as a beige solid which was not purified further, but used directly in the subsequent reaction (4.7 g, 86%).

mp = 145-146°C; **¹H-NMR** ($CDCl_3$, 270 MHz): δ 1.81 (m, 2H, $H_{2'}$), 3.43 (m, 2H, $H_{3'}$), 3.78 (s, 3H, OCH_3), 4.08-4.23 (m, 3H, $H_{1'} + Fmoc\ CH$), 4.49 (d, 2H, J = 6.41 Hz, $Fmoc\ CH_2$), 5.70 (br, 1H, NH), 7.14 (s, 1H, H_6), 7.26-7.41 (m, 5H, $Fmoc_{\text{aryl}} + H_3$), 7.59 (d, 2H, J = 7.51 Hz, $Fmoc_{\text{aryl}}$), 7.74 (d, 2H, J = 7.15 Hz, $Fmoc_{\text{aryl}}$), 9.62 (s, 1H, CO_2H); **¹³C-NMR** ($CDCl_3$, 68.7 MHz): δ 28.8 ($C_{2'}$), 39.1 ($C_{3'}$), 47.2 ($CH\ Fmoc$), 56.4 (OCH_3), 66.3 ($CH_2\ Fmoc$), 68.5 ($C_{1'}$), 107.9 (C_3), 111.1 (C_6), 120.0, 124.9, 127.1 and 127.7 ($CH\ Fmoc_{\text{aryl}}$), 128.0 (C_{arom}), 137.0 (C_{arom}), 141.3 ($C\ Fmoc_{\text{aryl}}$), 143.8 ($C\ Fmoc_{\text{aryl}}$), 148.2 (C_{arom}), 154.7 (C_{arom}), 156.8 (NC=O) 171.5 (CO_2H); **MS** (FAB) m/z (relative intensity): 493 ($M^{++} + 1$, 3), 297

(6), 271 (4), 191 (18), 180 (21), 179 (100), 178 (67), 165 (30), 102 (17), 93 (13); **HRMS** (FAB) exact mass calcd. for C₂₆H₂₅N₂O₈ (M+H): *m/e* 493.1532, obsd *m/e* 493.1536; **IR** (Nujol™) ν : (cm⁻¹) 1712, 1535, 1463, 1377, 1277, 1219, 1081, 970, 762, 722, 656.

5

Synthesis of (2S)-N-[4-(N-9-fluorenylmethoxycarbonyl)aminopropoxy-5-methoxy-2-nitrobenzoyl]pyrrolidine-2-methanol 47

A catalytic amount of DMF (2 drops) was added to a solution of the 10 nitrobenzoic acid **46** (8.0 g, 16.3 mmol) and oxalyl chloride (2.3 g, 17.9 mmol) in anhydrous DCM (120 mL), at room temperature under a nitrogen atmosphere. The reaction mixture was stirred for 16 hours and the resulting solution of acid chloride was cooled to 0°C (ice/acetone) under a nitrogen atmosphere. A solution of 15 pyrrolidinemethanol (1.8 g, 17.9 mmol) and DIPEA (4.6 g, 35.77 mmol) in anhydrous DCM (40 mL) was added dropwise over 30 minutes. Once the addition was complete, the reaction mixture was allowed to warm to room temperature. Stirring was continued for a further 2 hours, at which time TLC (95% EtOAc/MeOH) revealed complete reaction. The 20 reaction mixture was washed with 1 N aqueous HCl (2 x 100 mL), H₂O (2 x 100 mL), brine (100 mL), and dried over MgSO₄. Excess solvent was removed by evaporation under reduced pressure to give the crude compound as a brown oil. Purification by flash column chromatography (99% CHCl₃/MeOH) afforded the pure amide **47** as a beige solid (5.6 g, 25 82%)

$[\alpha]_D = -53.3^\circ$ (*c* = 1.03, CHCl₃); **mp** = 78-81°C; **¹H-NMR** (CDCl₃, 270 MHz): δ 1.69-1.88 (m, 4H, H4 + H3), 2.04-2.12 (m, 2H, H2'), 3.16 (m, 2H, H3'), 3.45 (m, 2H, H5), 3.81 (s, 3H, OCH₃), 3.86-3.91 (m, 2H, CH₂-OH), 4.08-4.24 (m, 3H, H1' + Fmoc CH), 4.38-4.48 (m, 3H, H2 + Fmoc CH₂), 5.65 (br, 1H, NH), 6.78 (s, 1H, H6_{arom}), 7.27-7.42 (m, 5H, H3_{arom} + Fmoc_{aryl}), 7.61 (d, 2H, *J* = 7.32 Hz, Fmoc_{aryl}), 7.76 (d, 2H, *J* = 7.32 Hz, Fmoc_{aryl}); **¹³C-NMR** (CDCl₃, 68.7 MHz): δ 24.4 (C4), 28.4 (C3), 28.9 (C2'), 39.1 (C3'), 47.3 (CH Fmoc), 49.5 (C5), 56.6 (OCH₃), 60.4 (C2), 61.5 (CH₂-OH), 66.2 (CH₂ Fmoc), 68.5 (C1'), 108.0 (C3_{arom}), 108.9 (C6_{arom}), 120.0, 124.9, 127.0 and 127.7 (CH Fmoc_{aryl}), 128.0 (C_{arom}), 137.0 (C_{arom}), 141.3 (C Fmoc_{aryl}), 143.9 (C Fmoc_{aryl}), 148.2 (C_{arom}), 154.7 (C_{arom}), 156.5 (NC=O_{carbamate}), 171.2 (C=O_{amide}); **MS** (FAB) *m/z* (relative

5

Synthesis of (2S)-[4-(N-9-fluorenylmethoxycarbonyl)amino propyloxy-5-methoxy-2-aminobenzoyl]pyrrolidine-2-methanol 48

A mixture of the nitro compound **47** (5.5 g, 9.5 mmol) and $\text{SnCl}_2/2\text{H}_2\text{O}$ (10.2 g, 45.4 mmol) in MeOH (100 mL) was heated at reflux and the progress of the reaction monitoring by TLC (95% $\text{CHCl}_3/\text{MeOH}$). After 2 hours excess MeOH was removed by evaporation under reduced pressure, the resulting residue was cooled (ice), and treated carefully with sat. aqueous NaHCO_3 (170 mL). The reaction mixture was diluted with EtOAc (170 mL) and after 16 hours stirring at room temperature the inorganic precipitate was removed by filtration through Celite. The organic layer was separated, washed with brine (150 mL), dried over MgSO_4 , filtered and evaporated *in vacuo* to give a brown solid. Purification by flash column chromatography (95% $\text{CHCl}_3/\text{MeOH}$) afforded the pure amine **48** as a greyish-pink solid (4.3 g, 82%)

$[\alpha]_D = -78.6^\circ$ ($c = 1.02$, CHCl_3); **mp** = 83-86°C; **¹H-NMR** (CDCl_3 , 270 MHz): δ 1.68-1.85 (m, 4H, $H4 + H3'$), 2.00-2.04 (m, 2H, $H2'$), 3.43-3.45 (m, 2H, $H3'$), 3.49-3.58 (m, 2H, $H5$), 3.67 (s, 3H, OCH_3), 3.72-3.78 (m, 2H, $\text{CH}_2\text{-OH}$), 4.04 (t, 2H, $J = 5.58$ Hz, $H1'$), 4.22 (t, 1H, $J = 6.86$ Hz, Fmoc CH), 4.41-4.44 (m, 3H, $H2 + \text{Fmoc CH}_2$), 5.92 (br, 1H, NH), 6.23 (s, 1H, $H3_{\text{arom}}$), 6.71 (s, 1H, $H6_{\text{arom}}$), 7.27-7.41 (m, 4H, $\text{Fmoc}_{\text{aryl}}$), 7.62 (d, 2H, $J = 7.32$ Hz, $\text{Fmoc}_{\text{aryl}}$), 7.75 (d, 2H, $J = 7.33$ Hz, $\text{Fmoc}_{\text{aryl}}$); **¹³C-NMR** (CDCl_3 , 68.7 MHz): δ 24.9 ($C4$), 28.6 ($C3$), 29.1 ($C2'$), 39.5 ($C3'$), 47.3 (CH Fmoc), 51.0 ($C5$), 56.6 (OCH_3), 60.4 ($C2$), 61.1 ($\text{CH}_2\text{-OH}$), 66.4 ($\text{CH}_2\text{ Fmoc}$), 68.0 ($C1'$), 102.0 ($C3_{\text{arom}}$), 111.6 ($C6_{\text{arom}}$), 120.0, 125.1, 127.0 and 127.7 ($\text{CH Fmoc}_{\text{aryl}}$), 128.0 (C_{arom}), 137.8 (C_{arom}), 141.3 ($C \text{Fmoc}_{\text{aryl}}$), 144.0 ($C \text{Fmoc}_{\text{aryl}}$), 148.2 (C_{arom}), 150.8 (C_{arom}), 156.6 ($\text{NC=O}_{\text{carbamate}}$), 171.9 ($\text{C=O}_{\text{amide}}$); **MS** (FAB) *m/z* (relative intensity): 546 ($M^+ + 1$, 11), 445 (10), 191 (14), 179 (100), 166 (51), 102 (70); **HRMS** (FAB) exact mass calcd for $C_{31}H_{37}N_3O_6$ ($M+H$): *m/e* 546.2526 obsd *m/e* 546.2532; **IR** (Nujol) ν : (cm^{-1}) 1698, 1622, 1588, 1506, 1476, 1404, 1228, 1173.

Synthesis of (2S)-N-[4-(N-9-fluorenylmethoxycarbonyl)amino propyloxy-5-methoxy-2-(N-resin-methoxybenzyloxycarbonyl)aminobenzoyl]pyrrolidine-2-methanol 49

5 The *p*-nitrophenyl carbonate Wang resin **31** (1 g, 0.54 mmol) was allowed to swell for 30 minutes in DCM/DMF (2:1, 10 mL) with gentle shaking in a round bottom flask equipped with a sintered glass filter tube. A solution of HOBT (0.22 g, 1.6 mmol), DIPEA (0.56 mL, 0.42 g, 3.2 mmol) and the amine **48** (1.47 g, 2.7 mmol) in DCM/DMF (2:1, 20 mL) 10 was added to the swollen resin. The reaction mixture was shaken for 6 hours at room temperature and allowed to stand overnight, after this time the supernatant was removed by vacuum filtration using the sintered filter tube. The resin was washed four times with DCM, MeOH, and Et₂O for 2 minutes each. After this, the resin was dried 15 *in vacuo* to afford the resin bound carbamate **49**.

Synthesis of (11*S*, 11*a**S*)-10-(N-resin-methoxybenzyloxycarbamate)-11-hydroxy-8-(N-9-fluorenylmethoxycarbonyl)aminopropyloxy-7-methoxy-1,2,3,6,9,11*a*-hexahydro-5*H*-pyrrolo[2,1-20 cl][1,4]benzodiazepin-5-one 50

The carbamate bearing resin **49** (0.54 mmol) was allowed to swell for 30 minutes in DCM/DMF (2:1, 10 mL) with gentle shaking. A solution of the Dess-Martin reagent (1.14 g, 2.7 mmol) in DCM/DMF (2:1, 20 mL) was added to the swollen resin. The reaction mixture was shaken for 25 2 hours at room temperature, after this time the supernatant was removed by vacuum filtration using the filter tube. The resin was washed four times with DCM, MeOH, and Et₂O for 2 minutes each. The resin was dried *in vacuo* to afford the resin bound carbinolamine **50**.

30 Synthesis of (11*a**S*)-8-(N-9-fluorenylmethoxycarbonyl)aminopropyloxy-7-methoxy-1,2,3,11*a*-tetrahydro-5*H*-pyrrolo[2,1-cl][1,4]benzodiazepin-5-one 51

The protected carbinolamine bound resin **50** (0.54 mmol) was suspended in TFA/DCM (1:1, 20 mL) and shaken for 2 hours at room temperature. 35 After this time the supernatant was decanted by pressure and the resin was washed twice with DCM. The deprotection protocol was repeated once to ensure complete cleavage of the PBD from the resin. The combined organic solution was diluted with water and carefully

neutralised with sat. aqueous NaHCO₃. The organic layer was separated, washed with H₂O (2 x 60 mL), brine (2 x 60 mL), dried over MgSO₄ and excess of solvent was removed by evaporation under reduced pressure. Purification by flash column chromatography (97% CHCl₃/MeOH) furnished the target compound **51** as a brown solid (67 mg, 24%) which was repeatedly evaporated *in vacuo* with CHCl₃ in an attempt to provide the N10-C11 imine form of the compound.

[α]_D = +397.5° (c = 0.67, CHCl₃); ¹H-NMR (CDCl₃, 270 MHz): δ 2.00-2.06 (m, 4H, H2 + H1), 2.26-2.31 (m, 2H, H2'), 3.45-3.47 (m, 2H, H3'), 3.52-3.62 (m, 2H, H3), 3.80 (s, 3H, OCH₃), 3.91-4.24 (m, 4H, H11a + H1' + Fmoc CH), 4.43-4.46 (m, 2H, Fmoc CH₂), 5.93 (br, 1H, NH), 6.78 (s, 1H, H6), 7.26-7.41 (m, 4H, Fmoc_{aryl}), 7.5 (s, 1H, H9), 7.61 (d, 2H, J = 7.14 Hz, Fmoc_{aryl}), 7.66 (d, 1H, J = 4.39 Hz, H11_{imine}), 7.75 (d, 2H, J = 7.33 Hz, Fmoc_{aryl}); ¹³C-NMR (CDCl₃, 68.7 MHz): δ 24.2 (C2), 29.0 (C1), 29.6 (C2'), 39.5 (C3'), 46.7 (C3), 47.4 (CH Fmoc), 53.7 (OCH₃), 56.0 (C11a), 66.3 (CH₂ Fmoc), 68.2 (C1'), 110.3 (C6), 111.4 (C9), 120.0 (C-H_{aryl} Fmoc), 120.5 (C_{arom}), 125.1, 127.0, and 127.6 (C-H_{aryl} Fmoc), 140.6 (C_{arom}), 141.3 (C_{aryl} Fmoc), 144.0 (C_{aryl} Fmoc), 147.7 (C_{arom}), 150.4 (C_{arom}), 156.6 (NC=O_{carbamate}), 162.6 (C11), 164.5 (C4_{amide}); IR (Nujol) ν : (cm⁻¹) 3364, 1711, 1686, 1600, 1521, 1472, 1244, 1217, 1021, 740, 679.

Example 10: Synthesis of 27 member tripeptide PBD library 60
(Figure 12)

A suspension of the amino PBD scaffold resin **30** (example 9) (0.45 mmol), in 2:1 DCE:DMF (30 mL) was evenly distributed between 27 Alltech tubes (1.5 mL volume). The process was repeated twice, excess solvent was removed by suction and the resin was rinsed with CH₂Cl₂ (2 x 5 mL) and dried *in vacuo*.

A solution of Fmoc-amino acid (0.05 mmol/tube) [Fmoc-alanine 15 mg/tube, Fmoc-glycine 14 mg/tube, Fmoc-phenylalanine 19 mg/tube], TBTU (15 mg, 0.05 mmol/tube) and DIPEA (8 mL, 0.05 mmol/tube) in DMF (500 mL) was added to resin **30** (0.017 mmol/tube) and allowed to shake for 16 hours. Resin **55** was filtered and rinsed with DMF (2 x 1 mL), CH₂Cl₂ (2 x 1 mL), MeOH (2 x 1 mL) and dried *in vacuo*.

The procedure was repeated once.

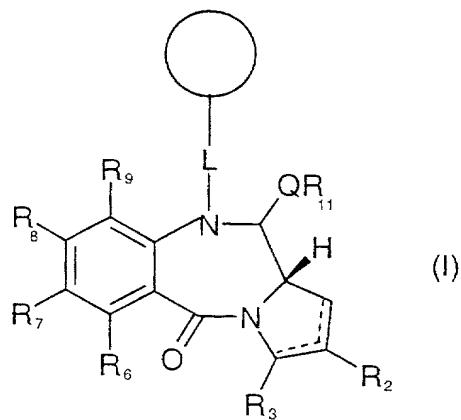

A solution of 20% piperidine in DMF (250 mL) was added to each tube and shaken for 2 hours. Resin **56** was filtered and rinsed
5 with DMF (2 x 1 mL), CH₂Cl₂ (2 x 1 mL), MeOH (2 x 1 mL) and dried in vacuo. The procedure was repeated once.

The above coupling and deprotection protocols were repeated twice until the library of 27 tripeptides **60** was generated.

CLAIMS

1. A compound of formula (I):

wherein:

5 R₂ and R₃ are independently selected from: H, R, OH, OR, =O, =CH-R, =CH₂, CH₂-CO₂R, CH₂-CO₂H, CH₂-SO₂R, O-SO₂R, CO₂R, COR and CN, and there is optionally a double bond between C1 and C2 or C2 and C3;

10 R₆, R₇, R₈ and R₉ are independently selected from H, R, OH, OR, halo, nitro, amino, Me₃Sn; or R₇ and R₈ together form a group -O-(CH₂)_p-O-, where p is 1 or 2;

15 R₁₁ is either H or R;

Q is S, O or NH;

L is a linking group, or a single bond;

15 O is a solid support;

where R is a lower alkyl group having 1 to 10 carbon atoms, or an aralkyl group of up to 12 carbon atoms, whereof the alkyl group optionally contains one or more carbon-carbon double or triple bonds, which may form part of a conjugated system, or an aryl group of up to 12 carbon atoms; and is optionally substituted by one or more halo, hydroxy, amino, or nitro groups, and optionally contains one or more hetero atoms, which may form part of, or be, a functional group.

25 2. A compound according to claim 1, except that one or more of R₂, R₃, R₆, R₇ and R₈ are independently X-Y-A-, where X is selected from -COZ', NHZ, SH, or OH, where Z is either H or an

nitrogen protecting group, Z' is either OH or an acid protecting group, Y is a divalent group such that HY = R, and A is O, S, NH, or a single bond.

5 3. A compound according to claim 2, wherein it is either R₂ and/or R₈ that is X-Y-A-.

4. A compound according to claim 1, except that one or more of R₂, R₃, R₆, R₇ and R₈ are independently:

10 H- (T)_n-X'-Y-A-

where:

X' is CO, NH, S or O,;

Y is a divalent group such that HY = R; SA is O, S, NH or a single bond;

15 T is a combinatorial unit;
and n is a positive integer.

5. A compound according to claim 4, wherein it is R₂ and/or R₈ that are independently:

20 H- (T)_n-X'-Y-A-.

6. A compound according to claim 4 or claim 5, wherein X' is / either CO or NH.

25 7. A compound according to any one of claims 4 to 6, wherein n is from 1 to 16.

8. A compound according to claim 7, wherein n is from 3 to 14.

30 9. A compound according to any one of the preceding claims, wherein R, and HY if Y is present, are independently selected from lower alkyl group having 1 to 10 carbon atoms, or an alkaryl group of up to 12 carbon atoms, or an aryl group of up to 12 carbon atoms, optionally substituted by one or more halo, hydroxy, amino, or nitro groups.

35 10. A compound according to claim 9, wherein R, and HY, if Y

*Article
34*

is present, are independently selected from lower alkyl group having 1 to 10 carbon atoms optionally substituted by one or more halo, hydroxy, amino, or nitro groups.

5 11. A compound according to claim 10, wherein R, and HY, if Y is present, are unsubstituted straight or branched chain alkyl groups, having 1 to 10 carbon atoms.

10 12. A compound according to any one of the preceding claims, wherein Q is O.

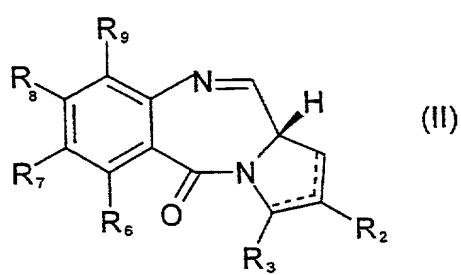

13. A compound according to any one of the preceding claims, wherein R₁₁ is H.

15 14. A compound according to any one of the preceding claims, wherein R₆ and R₉ are H.

15. A compound according to any one of the preceding claims, wherein R₇ is an alkoxy group.

20 16. A compound according to any one of the preceding claims, wherein R₂ and R₃ are H.

17. A compound of formula II:

25 wherein R₂, R₃, R₆, R₇, R₈ and R₉ are as defined in any one of claims 2 to 8.

18. A compound of formula II as defined in claim 17 for use in a method of therapy.

30 19. A pharmaceutical composition, comprising a compound of

formula II as defined in claim 17, and a pharmaceutically acceptable carrier or diluent.

20. The use of a compound of formula II as defined in claim
5 17 in the preparation of a medicament for the treatment of a
gene-based disease.

21. The use of a compound of formula II as defined in claim
10 17 in the preparation of a medicament for the treatment of
bacterial, parasitic or viral infections.

22. A collection of compounds all of which are represented by
formula I as defined in any one of claims 1 to 16.

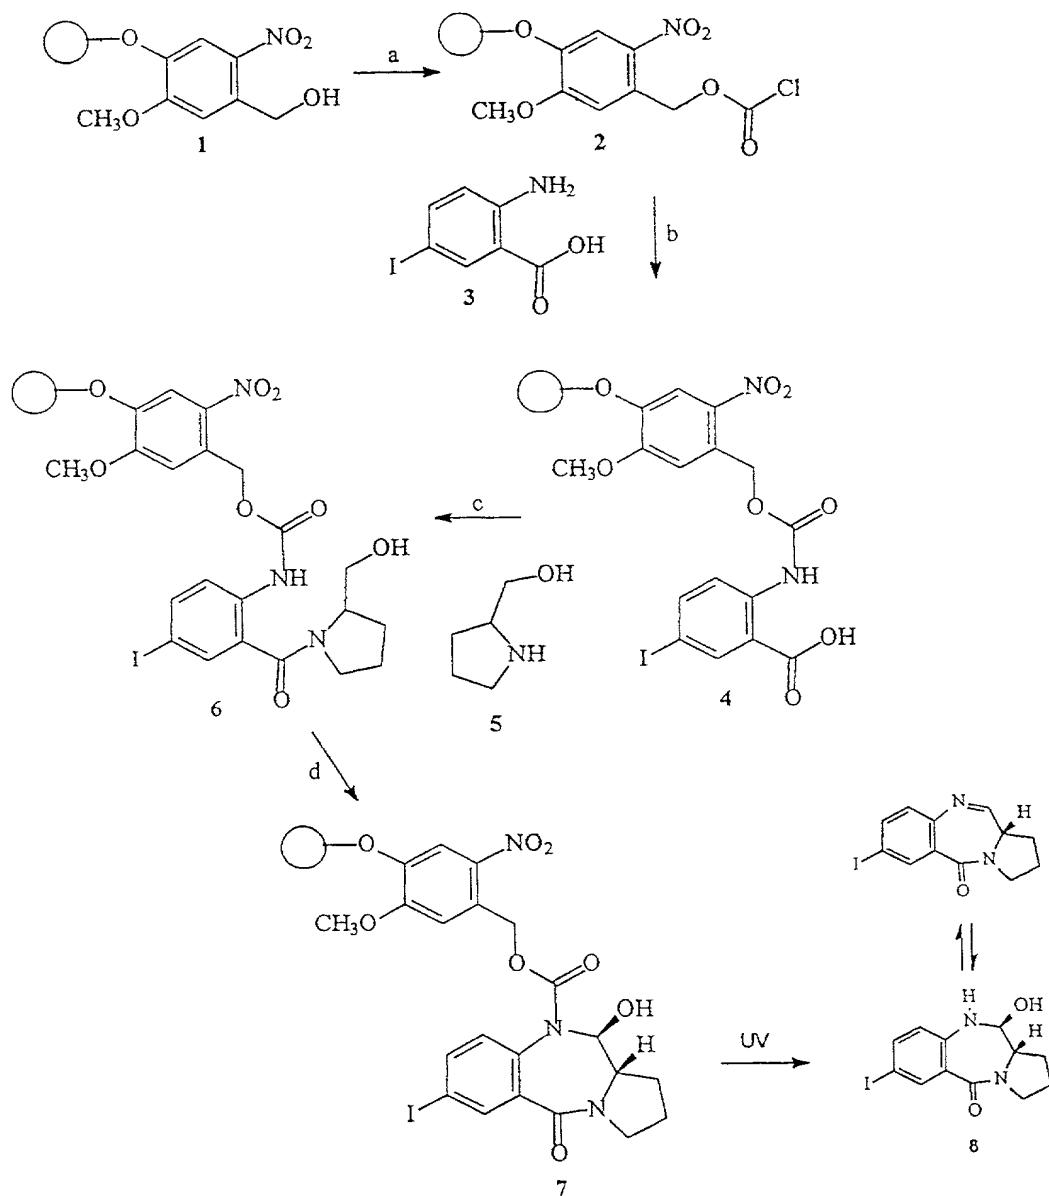

15 23. A collection of compounds all of which are represented by
formula II as defined in claim 17, wherein R₂, R₃, R₆, R₇ and R₈
are as defined in any one of claims 4 to 8, or in any one of
claims 9 to 11, 14, 15, or 16 as appendant, directly or
indirectly, on any one of claims 4 to 8.

20 24. A method of screening a collection of compounds of
formula II as defined in claim 17 to discover biologically
active compounds.

25 25. The use of a compound of formula II as defined in claim
17 in a method of target validation

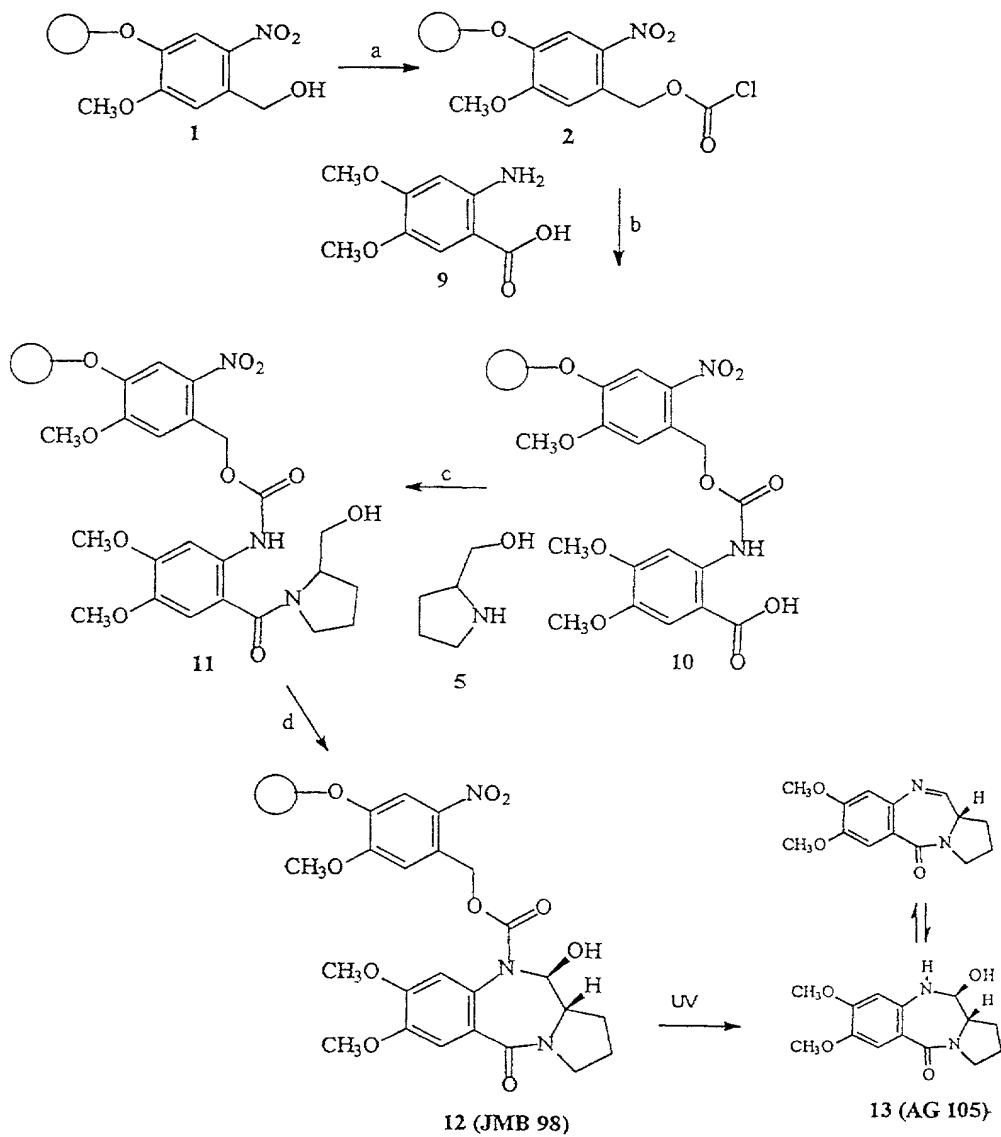

26. The use of a compound of formula II as defined in claim
17 in a method of functional genomics.

Declaration and Power of Attorney For Patent Application

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am an original, first and joint inventor of the subject matter which is claimed and for which a patent is sought on the invention entitled COLLECTIONS OF COMPOUNDS (Attorney Docket No. 65435-9001), the specification of which is attached hereto.

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose to the Patent and Trademark Office all information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, §1.56.

As a named inventor, I hereby appoint the following registered practitioners to prosecute this application and transact all business in the Patent and Trademark Office connected therewith:

Customer Number

23510

DIRECT ALL COMMUNICATIONS IN OR PERTAINING TO THIS APPLICATION TO:

Customer Number

23510

I hereby claim foreign priority benefits under Title 35, United States Code, §119 of the foreign application for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

Prior Foreign Application		
9818732.1 PCT/GB99/02839 (Number)	Great Britain Great Britain (Country)	27 August 1998 27 August 1999 (Day/Month/Year Filed)

The undersigned to this Declaration and Power of Attorney hereby authorize the U.S. attorneys named herein to accept and follow instructions from Mewburn Ellis, York House, 23 Kingsway, London WC2B 6HP, GREAT BRITAIN, as to any actions to be taken in the U.S. Patent and Trademark Office regarding this application without direct communication between the U.S. attorneys and the undersigned. In the event of a change in the person(s) from whom instructions may be taken, the undersigned will so notify the U.S. attorneys.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

Full name of first joint inventor: David Edwin Thurston

Inventor's signature D.E.T.

Date: 20 Feb 2001

Residence: Great Britain

Citizenship: Great Britain

Post Office Address: Cancer Research Campaign
Experimental Cancer Chemotherapy Laboratories
University of Nottingham
University Park, Nottingham GBY
Nottinghamshire, NG7 2RD
UNITED KINGDOM

Full name of second joint inventor: Philip Wilson Howard

Inventor's signature P.W.H.

Date: 20/2/2001

Residence: Great Britain

Citizenship: Great Britain

Post Office Address: Cancer Research Campaign
Experimental Cancer Chemotherapy Laboratories
University of Nottingham
